

Summary Report for MicroVal certificate 2011LR39, concerning the **foodproof® Salmonella** Detection Kits (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27) for detection of *Salmonella* in Infant formula and infant cereals, Probiotics containing products, Ingredients and Environmental samples

MicroVal study number: 2011LR39

Alternative methods: the **foodproof® Salmonella** Detection Kits (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27)

Summary Report: final version 28-01-2019

Contact MicroVal Expert laboratory:

This report is prepared in accordance with ISO 16140-2:2016 and MicroVal technical committee interpretation of ISO 16140-2 v.1.0

Authors: W. Jacobs-Reitsma, R. Diddens, E. Bouw, A. Gritchina, W. van Overbeek

Company: BIOTECON Diagnostics GmbH, Potsdam, Germany.

Expert Laboratory: RIVM-Z&O (National Institute for Public Health and the Environment, Centre for Zoonoses and Environmental Microbiology), Bilthoven, The Netherlands.

Kit names:

foodproof® Salmonella Detection Kits (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27) in combination with the **foodproof®** StarPrep One Kit (BIOTECON Diagnostics Cat. No. S 400 07) for manual DNA extraction, or the **foodproof®** Magnetic Preparation Kit IV (BIOTECON Diagnostics Cat. No. S 400 15) for automated DNA extraction

Validation standard:

EN ISO 16140-2:2016 Microbiology of the food chain – Method validation – Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method.

Reference methods:

EN ISO 6579-1:2017; Microbiology of the food chain – Horizontal method for the detection, enumeration and serotyping of *Salmonella* – Part 1: Detection of *Salmonella* spp.

EN ISO 6579:2002; Microbiology of food and animal feeding stuffs – Horizontal method for the detection of *Salmonella* spp.

Scope of validation:

Infant formula and infant cereals, Probiotics containing products, Ingredients, and Environmental samples.

Certification organization: Lloyd's Register

List of abbreviations/legends

A(lt)	Alternative method
AA	Alpha-amylase added to initial BPW (at 50 mg per 100 gram sample)
AL	Acceptability Limit
Art. Cont.	artificial contamination
BPW	Buffered Peptone Water
BV	Vancomycin added to initial BPW (at 10 mg/l)
CFU	Colony Forming Units
D	Double-concentrated BPW
DV	Double-concentrated BPW plus vancomycin (at 10 mg/l)
EB	<i>Enterobacteriaceae</i>
EB/C	<i>Enterobacteriaceae / Cronobacter</i>
EBC test kit	PCR test kit for detection of <i>Enterobacteriaceae</i> and <i>Cronobacter</i>
EL	Expert Laboratory
FP	False Positive
FPR	False Positive Ratio
g	Gram
h	Hour
ILS	Interlaboratory Study
Inh	inhibition
LDC	I-Lysine decarboxylation medium
LOD	Level of Detection
MCS	Method Comparison Study
min	minute
MKTTn	Muller-Kauffmann tetrathionate-novobiocin broth
ml	millilitre
MSRV	Modified Semi-solid Rappaport Vassiliadis medium
MVTC	MicroVal Technical Committee
NA	Negative Agreement
na	not applicable
NuA	Nutrient Agar
ND	Negative Deviation
neg (-)	negative/no growth/no reaction/target not detected
ng	no growth at all
ns	Non-Suspect growth
nt	not tested
PA	Positive Agreement
PD	Positive Deviation
pos (+)	positive/growth/target detected
PPNA	Presumptive Positive Negative Agreement (belongs to the False Positive results)
PPND	Presumptive Positive Negative Deviation (belongs to the False Positive results)
R(ef)	Reference method
rep	repetition
rep(*neg)	repetition indicated by the Diagnostic Interpreter system, but negative by personal interpretation of the curve
rep(*pos)	repetition indicated by the Diagnostic Interpreter system, but positive by personal interpretation of the curve
RIVM	National Institute for Public Health and the Environment
RLOD	Relative Level of Detection
r/r	repetition/repetition (first result: repetition/second result: repetition)
RVS	Rappaport-Vassiliadis Soya broth
RT	Relative Trueness
S	Suspect growth
S (n.c.)	Suspect growth, but negative confirmed after the confirmation steps

SE	Relative Sensitivity
SP	Relative Specificity
S test kit	PCR test kit for detection of <i>Salmonella</i>
TP	True Positive
TSA	Tryptone Soya Agar
TSI	Triple Sugar Iron agar
UA	Urea Agar
XLD	Xylose Lysine Deoxycholate agar
Z&O	Centre for Zoonoses and Environmental Microbiology

For easier recognition, the following colour-codes were used throughout the report:

Reference method	Reference method
StarPrep One Kit	StarPrep One Kit
MagPrep IV	Magnetic Preparation Kit IV
PCR kit A	PCR kit A
PCR Kit B	PCR Kit B
kit A/B	PCR Kit A and PCR kit B
P1 3 h 2nd BPW	3 h incubation of second BPW
P2 20 h 2nd BPW	20 h incubation of second BPW
Totals	Totals
ND, PD	ND, PD, deviating results

1. Introduction

In this project an **extension** of MicroVal certificate 20011LR39 (detection of *Salmonella* spp., after screening for presence of *Enterobacteriaceae*, RIVM Confidential Reports 330634001/2012 and 330634002/2012) was carried out by RIVM-Z&O as the MicroVal Expert laboratory.

The extension to this certificate basically concerned the **DNA extraction step (foodproof® Magnetic Preparation Kit IV (BIOTECON Diagnostics Cat. No. S 400 15), in combination with the KingFisher® Flex instrument, as an automated extraction step).**

In addition, this extension also included:

- New Category: Environmental samples, using the original (manual) DNA extraction method (**foodproof® StarPrep One**, BIOTECON Diagnostics Cat. No. S 400 07).
- New test protocol for the Category Probiotics containing products: 3-4 h incubation of the second enrichment step in BWP using the original (manual) DNA extraction step (**foodproof® StarPrep One**, BIOTECON Diagnostics Cat. No. S 400 07).

To align with all 4 Categories as concurrently tested for the closely related study LR 8/9/19/20 (detection of *Enterobacteriaceae* and/or *Cronobacter* spp.), all (joint) samples within the sensitivity study and the RLOD study were tested also within the LR 39 study.

Meanwhile, also the **renewal** of MicroVal certificate 2011LR39 was carried out by RIVM-Z&O as the MicroVal Expert Laboratory. The original validation study for certificate LR 39 concerning 3 categories (2012, RIVM Confidential Reports 330634001/2012 and 330634001/2012) was elaborated according to ISO 16140:2003. All available data were re-evaluated according to ISO 16140-2:2016, and the validation data were confirmed to be valid.

This report combines the applicable data from both the extension study and the renewal study into one complete overview on the current situation for MicroVal certificate LR 39.

The alternative methods are:

Alternative method **PCR test kits A:**

* the **foodproof® Salmonella** Detection Kit, - **Hybridization probes** - (BIOTECON Diagnostics Cat. No. R 310 27); after pre-screening by using * the **foodproof® Enterobacteriaceae plus Cronobacter** Detection Kit, **-Hybridization probes-** (BIOTECON Diagnostics Cat. No. R 310 15.1);

in combination with the following necessary kits and reagents for DNA extraction:

- Manual DNA extraction:
 - o Reagent D (BIOTECON Diagnostics Cat. No. A 500 02)
 - o the **foodproof® StarPrep One Kit** (BIOTECON Diagnostics Cat. No. S 400 07)
- Or
- Automated DNA extraction:
 - o Reagent D (BIOTECON Diagnostics Cat. No. A 500 02)
 - o the **foodproof® Magnetic Preparation Kit IV** (BIOTECON Diagnostics Cat. No. S 400 15)

Alternative method **PCR test kits B:**

* the **foodproof® Salmonella** Detection Kit, - **5'Nuclease** - (BIOTECON Diagnostics Cat. No. R 302 27); after pre-screening by using * the **foodproof® Enterobacteriaceae plus Cronobacter** Detection Kit, **-5' Nuclease-** (BIOTECON Diagnostics Cat. No. R 302 15.1);

in combination with the following necessary kits and reagents for DNA extraction:

- Manual DNA extraction:
 - o Reagent D (BIOTECON Diagnostics Cat. No. A 500 02)
 - o the **foodproof® StarPrep One Kit** (BIOTECON Diagnostics Cat. No. S 400 07)

Or

- Automated DNA extraction:
 - o Reagent D (BIOTECON Diagnostics Cat. No. A 500 02)
 - o the **foodproof® Magnetic Preparation Kit IV** (BIOTECON Diagnostics Cat. No. S 400 15)

The reference method is:

ISO 6579-1:2017; Microbiology of the food chain – Horizontal method for the detection, enumeration and serotyping of *Salmonella* – Part 1: Detection of *Salmonella* spp.

The validation studies were carried out using the reference method as described in ISO 6579:2002; Microbiology of food and animal feeding stuffs – Horizontal method for the detection of *Salmonella* spp.. A new version of ISO 6579 was published in 2017, and the main changes introduced in the 2017 version compared to ISO 6579:2002 are considered as minor. Therefore, the validation data can be considered valid for both version ISO 6579:2002 and version ISO 6579-1:2017.

Scope of the validation study (Categories):

Original Certificate 2011LR39	2018 Certificate LR39
Powdered infant formula	Infant formula and infant cereals
Probiotic culture powders/pre-blends	Probiotics containing products
Ingredients	Ingredients
	Environmental samples

Criteria evaluated during the Extension/Renewal studies have been:

- Method Comparison Study (MCS)
 - o Sensitivity study
 - o Relative level of detection study
 - o Inclusivity and exclusivity study
- Interlaboratory Study (ILS)

Overall, the conclusions for the Method Comparison Study and the Interlaboratory Study are:

The alternative method foodproof® *Salmonella* Detection Kit (Hybridization probes and 5'Nuclease), using the foodproof® **StarPrep One Kit for manual DNA extraction, shows comparable performance to the reference method ISO 6579-1:2017 for the detection of *Salmonella* in Infant formula and infant cereals, Probiotics containing products, Ingredients, and Environmental samples.**

The alternative method foodproof® *Salmonella* Detection Kit (Hybridization probes and 5'Nuclease), using the foodproof® **Magnetic Preparation Kit IV for automated DNA extraction, shows comparable performance to the reference method ISO 6579-1:2017 for the detection of *Salmonella* in Infant formula and infant cereals, and in Probiotics containing products.**

The scope for the **foodproof® Magnetic Preparation Kit IV** for automated DNA extraction is **restricted** to Infant formula and infant cereals, and Probiotics containing products, the latter needing the specific sub-cultivation protocol (second BPW for 20 h at 37°C).

The overview on the claims for the current LR39 is given in the Table below:

Detection of *Salmonella*

Enrichment	Standard protocol: 100 g sample material* plus 900 ml BPW pre-warmed at 37 °C, 16 - 20 h at 37 °C ± 1 °C									
Subcultivation	Standard protocol P1: 100 µl of BPW culture in 900 µl BPW, 3 - 4 h at 37 °C ± 1 °C (shaking at 900 U/min)									
	Specific protocol P2: 100 µl of BPW culture in 900 µl BPW, 20 - 24 h at 37 °C ± 1 °C (shaking at 900 U/min)									
Reagent D treatment	A 500 02

2. Method Protocols

2.1 Reference method

See the flow diagram of the reference method in Annex A.

2.2 Alternative methods

See the flow diagram of the alternative methods in Annex B.

In short, the alternative method is using "reagent D" treatment (BIOTECON Diagnostics Cat. No. A 500 02) for rapid elimination of DNA from dead bacterial cells to avoid false-positive PCR results.

The foodproof® **StarPrep One Kit** is used for manual extraction of DNA from Gram-negative bacteria like *Enterobacteriaceae* for direct use in PCR.

The foodproof® **Magnetic Preparation Kit IV** (BIOTECON Diagnostics Cat. No. S 400 15), in combination with the KingFisher® Flex instrument, is used for automated DNA extraction.

Presence of *Enterobacteriaceae* is tested by real-time PCR: test kit BIOTECON Diagnostics Cat. No. R310 15.1 (Hybridization probes) and test kit BIOTECON Diagnostics Cat. No. R 302 15.1 5'Nuclease).

Samples positive for *Enterobacteriaceae* are next tested on presence of *Salmonella* by *Salmonella*-specific real-time PCR: test kit BIOTECON Diagnostics Cat. No. R 310 27 (Hybridization probes) and test kit BIOTECON Diagnostics Cat. No. R 302 27 (5'Nuclease).

The **microproof** Diagnostic Interpreter software is used for easy handling and interpretation of the PCR results.

The various kit inserts are given in the following Annexes:

Annex D: Kit insert reagent D (BIOTECON Diagnostics Cat. No. A 500 02; version 3, April 2018).

Annex E: Kit insert foodproof® **StarPrep One Kit** (BIOTECON Diagnostics Cat. No. S 400 07; version 6, November 2018).

Annex F: Kit insert foodproof® **Magnetic Preparation Kit IV** (BIOTECON Diagnostics Cat. No. S 400 15; version 1, August 2014).

Annex G: Kit insert EBES test kit A: foodproof® *Enterobacteriaceae* plus *Cronobacter* Detection Kit - Hybridization probes - (BIOTECON Diagnostics Cat. No. R 310 15.1; version 5, October 2018, as updated according to MicroVal rules).

Annex H: Kit insert EBES test kit B: foodproof® *Enterobacteriaceae* plus *Cronobacter* Detection Kit - 5'Nuclease - (BIOTECON Diagnostics Cat. No. R 302 15.1; version 3, November 2018, as updated according to MicroVal rules).

Annex I: Kit insert S test kit A: foodproof® *Salmonella* Detection Kit - Hybridization probes - (BIOTECON Diagnostics Cat. No. R 310 27; version 5, October 2018, as updated according to MicroVal rules).

Annex J: Kit insert S test kit B: foodproof® *Salmonella* Detection Kit – 5'Nuclease - (BIOTECON Diagnostics Cat. No. R 302 27; version 5, November 2018, as updated according to MicroVal rules).

NB: Study LR 39 and Study LR 8/9/19/20 are closely related and have the Annexes D – H on the kit inserts in common.

2.3 Study design

Both the original validation study 2011LR39 and the extension study were carried out using 100 gram test portions of sample material, because that is the sample size widely used in routine testing laboratories. The validation data are considered also to be valid for smaller amounts of samples (e.g. 10 or 25 gram), as long as the (minimum) primary dilution 1 in 10 of the sample in BPW is used.

A question on the reference method was put forward in the protocol-approval phase of the study (2016), concerning the use of vancomycin when testing probiotics containing samples as indicated in the protocol of the alternative method under study. No sample preparation for probiotic containing products was given in the reference method or relevant part of ISO 6887 at the time. However, the ISO reference method is stating: "prepare the test samples in accordance with the relevant part of ISO 6887 dealing with the product concerned. If ISO 6887 is not appropriate, it is recommended that the parties concerned come to an agreement on this subject." Therefore it could be decided to use vancomycin for the reference method as well (for the probiotic containing samples). Moreover, vancomycin does not impair growth, it was used in the original validation study and adding would be more challenging for the alternative method. After discussing this question, the MVTC decided (30th meeting) that the study can be conducted as a **paired** study. Nowadays, ISO 6887-4:2017 is allowing the addition of antibiotics when testing samples containing probiotics, and section 9.8.2 referring to ISO 27205 which specifically describes the use of vancomycin.

The reference and the alternative methods were performed with the same test portion, starting with the same specific pre-enrichment in BPW (see Annex C). This guidance on specific sample preparations was also taken up in the relevant test kit inserts of the alternative methods.

Method descriptions and kit inserts of the various steps in the alternative methods are given in the Annexes D-J. The **micro**proof Diagnostic Interpreter software was used for easy handling and interpretation of the PCR results. In case of a "repetition" result, guidelines as now given in the updated kit inserts were followed.

For the extension study, the Expert Laboratory performed the PCR tests (kit A, hybridization probes) on a LightCycler 480 II real-time PCR system (Roche), using the **micro**proof Diagnostic Interpreter software for analysis of the PCR data and data interpretation. Additionally, test kit B (5'Nuclease) was validated by an external laboratory (BIOTECON Diagnostics, Potsdam, Germany) using a LightCycler 480 II system, on blindly-coded DNA samples.

In the original study, the Expert laboratory performed the PCR tests (kit A, hybridization probes) on a LightCycler® 2.0 real-time PCR system (Roche). Additionally, the complete method comparison study was also validated using the LC 480 II (Roche) PCR machine for test kit A and using the PCR machines LC 480 II (Roche), Mx3005p (Agilent) and iQ5 (Bio-Rad) for test kit B, based on testing blindly-coded DNA samples by an external laboratory (BIOTECON Diagnostics, Potsdam, Germany). The raw data on the various additional PCR machines from the original study report are given in Annex Q for information.

Note that the practical work of the extension study on 2011LR39 was combined with the extension study on MicroVal certificate 2009LR8/9/19/20 (BIOTECON alternative methods for detection of *Enterobacteriaceae* (EB) and/or *Cronobacter* (C)), because the same set of samples were used for both detection of EB and/or *Cronobacter* as well as detection of *Salmonella* after the pre-screening for EB(/C).

3. Method comparison study

3.1 Sensitivity study

The sensitivity study (SE) is the ability of the method selected to detect the analyte by either the reference or the alternative method.

3.1.1 Categories and sample types

A total of 4 Categories were included in this validation study.

A minimum of 60 Items for each Category were tested by both the reference methods and the alternative methods in the sensitivity study, with a minimum of 30 positive samples per Category. Each Category was made up of 3 Types, with at least 20 Items representative for that Type.

The categories, the types and the number of samples analyzed are presented in Table 1 applicable to both the **StarPrep One Kit** and the **MagPrep IV**.

Table 1 - Categories, types and number of samples analysed, applicable to both the StarPrep One Kit and the MagPrep IV (PCR test kit A and test kit B).

Category	Type	Alternative method protocols ¹		Test portion size	Number of samples tested
		1	2		
1	Infant formula and infant cereals	a	Infant formula (intended for infants < 1 year)	x	100 g
		b	Infant formula (intended for infants > 1 year)	x	100 g
		c	Infant cereals	x	100 g
2	Probiotic containing products	a	Probiotic infant formula	x	100 g
		b	Probiotic infant cereals	x	100 g
		c	Probiotic ingredients	x	100 g
3	Ingredients	a	Standard ingredients	x	100 g
		b	Infant cereals ingredients	x	100 g
		c	Premixes	x	12,5 g
4	Environmental samples	a	Sweep samples/equipment swabs	x	swabs
		b	Traject samples (in-line factory)	x	100 g
		c	Vacuum cleaner residues	x	100 g

¹ Alternative method protocols:

1	3 h incubation of second BPW
2	20 h incubation of second BPW

A total of 264 samples were analyzed. The distribution of positive and negative samples per tested category and type is given in Table 2, applicable to both the StarPrep One Kit and the MagPrep IV and identical for PCR test kits A and PCR test kits B, except for 1 missing value as indicated.

Table 2 - Distribution per tested category and type: applicable to both the StarPrep One Kit and the MagPrep IV (PCR test kit A and PCR test kit B).

Category	Type	Positive* samples	Negative samples	Total
1	Infant formula and infant cereals	a	11	11
		b	9	12
		c	10	11
		Total	30	34
2	Probiotic containing products	a	11	12

4	Environmental samples	a	11	13
		b	10 ¹	12
		c	11	9
		Total	32	34
Total		125	139	264

*Positive by at least one of the methods

¹ One missing value for test kit B, MagPrep Kit IV.

3.1.2 Test sample preparation

None of the samples tested were naturally contaminated with *Salmonella*.

Naturally contaminated samples would preferentially be analyzed, but due to the nature of the samples and the target organism it was clear that artificial contaminations were needed.

The artificial contaminations are presented in Annex K. Note that generally the same samples were used for both the LR39 study and the closely related LR 8/9/19/20 study, therefore using artificial inoculations with combinations of *Salmonella* and *Cronobacter* strains.

Generally, a seeding protocol was used, adding a pinch of skim milk powder-dried strains to the test samples and leaving this at room temperature for a minimum of 2 weeks before actual testing. In some cases a *Salmonella* lenticule (drying/freezing stress) was used for direct inoculation (spiking).

150 samples were artificially contaminated with *Salmonella*, using 38 different strains. 125 gave a positive result for *Enterobacteriaceae*, followed by a positive result for *Salmonella*.

The same strain (or strain combination) was not used to inoculate more than 6 samples.

3.1.3 Confirmation protocols

Confirmation of *Salmonella* was done according to ISO 6579 (serological; biochemical: TSI, UA, LDC).

Samples showing discordant results were re-tested by using the cold-stored initial BPW enrichment, both directly and as another test portion of 10 ml submitted again to ISO 6579 (RVS, MKTTn, additionally MSRV).

3.1.4 Sensitivity study results

All raw data on the sensitivity study are given in Annex L. Sample numbers in bold indicate artificial inoculation of the sample (see Annex K for details on artificial inoculation).

The summary of results of the reference method and the alternative methods, the **StarPrep One Kit** and the **MagPrep IV**, for all Categories, and PCR test kit A and test kit B, are given in Tables 3 (Categories 1, 2.1, 3, and 4) and Tables 4 (Categories 1, **2.2**, 3, and 4).

Table 3-S/Table 4-S - Summary of sensitivity study results: StarPrep One Kit, all categories (1, 2.1 or **2.2, 3, 4)**

Test kit:		Reference method positive (R+)	Reference method negative (R-)
A/B	Alternative method positive (A+)	Positive agreement (R+/A+) PA = 121	Positive deviation (R-/A+) PD = 1
A/B	Alternative method negative (A-)	Negative deviation (R+/A-) ND = 3	Negative agreement (R-/A-) NA = 139

Table 4-M - Summary of sensitivity study results: MagPrep IV all categories (1, 2.1, 3, 4)

Test kit:		Reference method positive (R+)	Reference method negative (R-)
Test kit A	Alternative method positive (A+)	Positive agreement (R+/A+) PA = 114	Positive deviation (R-/A+) PD = 1
Test kit A	Alternative method negative (A-)	Negative deviation (R+/A-) ND = 10	Negative agreement (R-/A-) NA = 139
Test kit B	Alternative method positive (A+)	Positive agreement (R+/A+) PA = 114	Positive deviation (R-/A+) PD = 1
Test kit B	Alternative method negative (A-)	Negative deviation (R+/A-) ND = 9	Negative agreement (R-/A-) NA = 139

¹ One missing value for test kit B

Table 4-M - Summary of sensitivity study results: MagPrep IV all categories (1, **2.2, 3, 4)**

Test kit:		Reference method positive (R+)	Reference method negative (R-)
Test kit A	Alternative method positive (A+)	Positive agreement (R+/A+) PA = 115	Positive deviation (R-/A+) PD = 1
Test kit A	Alternative method negative (A-)	Negative deviation (R+/A-) ND = 9	Negative agreement (R-/A-) NA = 139
Test kit B	Alternative method positive (A+)	Positive agreement (R+/A+) PA = 115	Positive deviation (R-/A+) PD = 1
Test kit B	Alternative method negative (A-)	Negative deviation (R+/A-) ND = 8	Negative agreement (R-/A-) NA = 139

¹ One missing value for test kit B

Tables 5 (PCR test kit A) and Tables 6 (PCR test kit B) show the interpretation of sample results between the reference and alternative method (based on the confirmed alternative method), for each of the alternative method protocols under study.

3.1.5 Sensitivity study calculations

The sensitivity study parameters as specified in Table 7 (ISO 16140-2:2016) were calculated for all Categories and Types, and the overview for each of the alternative method protocols under study is given in Tables 8 (PCR test kit A) and Tables 9 (PCR test kit B). More False Positive results were seen for test kit B than for test kit A (Table 9-S and Table 8-S), using the StarPrepOne Kit, most often due to an initial repetition result. This maybe could have been caused by the fact that the DNA samples to be tested by kit B were transported to an external laboratory before testing.

Table 7 – Formula to calculate the sensitivity parameters

Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100\%$
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100\%$
Relative trueness	$RT = \frac{(PA + NA)}{N} \times 100\%$
False positive ratio for the alternative method	$FPR = \frac{(FP)}{NA} \times 100\%$

Table 8-S – Overview calculated sensitivity parameters per Category and Type:

¹ ND: including PPND

For the alternative method protocol **Magnetic Preparation Kit IV** (*PCR kit A and PCR kit B*), the observed values for ND-PD and ND+PD for each of the individual categories meet the acceptability limits (observed values \leq AL). Regarding the combination of "all categories", the observed values for ND+PD also meet the acceptability limit, but the observed value for ND-PD was found to be $>$ AL (Table 12-M and Table 13-M).

In comparison to the **StarPrep One Kit** results (Table 12-S and Table 13-S), the **Magnetic Preparation Kit IV** seems to result in more ND results mainly in the Categories 2.1, 3, and 4. After discussion, the MVTC therefore decided (36th meeting) that the validation scope of the **Magnetic Preparation Kit IV** will be **restricted to the Categories 1 and 2.2 only** (Infant formula and infant cereals, and Probiotics containing products with the specific protocol P2 for sub-cultivation).

3.1.7 Conclusion sensitivity study

The **foodproof® Salmonella** Detection Kits (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27),

- In combination with the **foodproof® StarPrep One Kit** for manual DNA extraction:

The observed values for ND-PD and ND+PD for the 4 individual categories (Infant formula and infant cereals, Probiotics containing products, Ingredients, Environmental samples) and for all categories meet the acceptability limits (observed values \leq AL).

- In combination with the foodproof® Magnetic Preparation Kit IV for automated DNA extraction:

The observed values for ND-PD and ND+PD for the restricted 2 individual categories (Infant formula and infant cereals, and Probiotics containing products with the specific protocol P2 for sub-cultivation) and for both categories meet the acceptability limits (observed values \leq AL).

3.2 Relative level of detection study

The relative level of detection is the level of detection at $P = 0,50$ (LOD_{50}) of the alternative method divided by the level of detection at $P = 0,50$ (LOD_{50}) of the reference method.

3.2.1 Categories, sample types and strains

One item and one relevant target micro-organism for this item was chosen for each of the Categories in this validation study, as shown in Table 14.

Table 14 - List of selected items and strains per category, as tested within the relative level of detection study.

Category	Item	Strain	Reference number	Strain origin	Seeding/spiking procedure
Infant formula/ infant cereals	Infant formula	<i>Salmonella Paratyphi B</i> var. Java	Salm 5F	Skim milk powder	at least 2 weeks at room temperature
Probiotic containing products	Infant formula plus probiotics (L. reuteri)	<i>Salmonella Typhimurium</i>	ATCC 14028	Chicken organs	Lenticule based
Ingredients	Starch	<i>Salmonella Derby</i>	NCTC 5722	Not stated	Lenticule based
Environmental samples	Vacuum cleaner residues	<i>Salmonella Stourbridge</i>	S95	Environment	at least 2 weeks at room temperature

3.2.2 Test sample preparations

At least 3 different levels of inoculation per separate target micro-organism and item were tested by both the reference method and the alternative methods:

- Negative control, which was non-inoculated (5x)
- A level producing fractional recovery, which was inoculated with 0,59 – 1 CFU per sample (20x)
- A higher level, which was inoculated with 5,9 – 10 CFU per sample (5x).

Test portions were individually inoculated and kept at an appropriate time/temperature for stabilization before actual testing (see Table 14).

3.2.3 RLOD study results

The tabulated raw data on the RLOD study are given in Annex M.

The RLOD calculations were performed using the Excel spread sheet (version 06-07-2015) as described in ISO 16140-2: 2016.

The RLOD per Category and for each of the alternative method protocols under study is given in Tables 15.

Upon request, also POD-LOD calculations were performed. Results are given in Annex N, for information only.

Table 15-S – Presentation of RLOD before and after confirmation of the alternative method results: StarPrep One Kit, PCR test kit A plus test kit B

Category	Item	Alt method protocol	RLOD using the alternative method results		RLOD using the confirmed alternative method results	
			PCR kit A	PCR kit B	PCR kit A	PCR kit B
1	Infant formula	1	1,000	1,000	1,000	1,000
2.1	Infant formula containing probiotics	1	1,000	1,000	1,000	1,000
2.2	Infant formula containing probiotics	2	1,000	1,000	1,000	1,000

4	Vacuum cleaner residues	1	1,000	1,000	1,000	1,000
<i>Combined</i>			1,000	1,000	1,000	1,000

Table 15-S – Presentation of RLOD before and after confirmation of the alternative method results: MagPrep IV, PCR test kit A plus test kit B

Category	Item	Alt method protocol	RLOD using the alternative method results		RLOD using the confirmed alternative method results	
			PCR kit A	PCR kit B	PCR kit A	PCR kit B
1	Infant formula	1	1,000	1,000	1,000	1,000
2.1	Infant formula containing probiotics	1	1,000	1,000	1,000	1,000
2.2	Infant formula containing probiotics	2	0,872	0,872	0,872	0,872
3	Starch	1	1,000	1,000	1,000	1,000
4	Vacuum cleaner residues	1	1,208	1,000	1,208	1,000
<i>Combined</i>			1,000	0,973	1,000	0,973

3.2.4 Conclusion RLOD study

The RLOD values (using the confirmed alternative method results) meet the acceptability limit, which is 1,5 for paired studies, for all 4 Categories and for each of the alternative method protocols as studied.

3.3 Inclusivity and exclusivity study

Inclusivity is the ability of the alternative method to detect the target analyte from a wide range of strains.

Exclusivity is the lack of interference from a relevant range of non-target strains of the alternative method.

3.3.1 Protocols inclusivity and exclusivity study

To meet the new criterion in ISO 16140-2:2016 on the number of *Salmonella* strains to be tested for inclusivity (n=100), another 57 strains of *Salmonella* spp. were selected for inclusivity testing, in addition to the 50 strains already tested in the original validation study.

Overnight cultures of pure strains in BPW (18 ± 2h at 37°C) were diluted in peptone saline to contain about 10 -100 cfu/ml and added (1 ml) to fresh portions of 90 ml BPW and processed according to the alternative method only, using the original DNA extraction method (StarPrep One kit). No matrix was added.

3.3.2 Results inclusivity and exclusivity study

All tabulated raw data on inclusivity, both from the original study and the additionally tested strains, are given in Annex O.

The tabulated raw data on exclusivity from the original study are given in Annex P.

A total of 107 *Salmonella* strains were tested for inclusivity. All of these strains showed the expected positive result with the alternative method.

A total of 30 non-*Salmonella* strains were tested for exclusivity. All of these strains showed the expected negative result with the alternative method.

3.3.3 Conclusion inclusivity and exclusivity study

The alternative *Salmonella* detection method protocols as studied are selective and specific.

3.4 Conclusions Method Comparison Study

Overall, the conclusions for the Method Comparison Study are:

On the **foodproof® *Salmonella* Detection Kits** (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27),

- In combination with the **foodproof® StarPrep One Kit** for manual DNA extraction:
 - o The observed values for ND-PD and ND+PD for the 4 individual categories (Infant formula and infant cereals, Probiotics containing products, Ingredients, Environmental samples) and for all categories meet the acceptability limits (observed values \leq AL).
 - o The RLOD values (using the confirmed alternative method results) meet the acceptability limit, which is 1,5 for paired studies, for both categories tested.
 - o The alternative *Salmonella* detection method is selective and specific.
- In combination with the **foodproof® Magnetic Preparation Kit IV** for automated DNA extraction:
 - o The observed values for ND-PD and ND+PD for the restricted 2 individual categories (Infant formula and infant cereals, and Probiotics containing products with the specific protocol P2 for sub-cultivation) and for both categories meet the acceptability limits (observed values \leq AL).
 - o The RLOD values (using the confirmed alternative method results) meet the acceptability limit, which is 1,5 for paired studies, for both categories tested.
 - o The alternative *Salmonella* detection method is selective and specific.

4. Interlaboratory Study

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

4.1 Study organisation

The interlaboratory study data as obtained during the original LR8/9/19/20 validation studies are considered to be valid as well for the more recent extension and renewal studies.

All detailed information on the organization of the interlaboratory study, sample preparations and distribution, controls, etc., as well as all raw data on the interlaboratory study can be found in the original 2011LR39 ILS report (RIVM Confidential Report 330634002/2012).

The existing interlaboratory study data were successfully re-evaluated according to the ISO 16140-2 (2016) and the MVTC interpretation document (doc 2016-082 GC) and described in the Renewal report (RIVM-Z&O Confidential Letter-Report 00109/2017).

4.2 Calculation and summary of data

The overview on the ILS results from the expert laboratory (EL) and from all 15 collaborative laboratories (A-N) is given in Annex R.

4.3. Results of the collaborators retained for interpretation

Laboratories H and L reported several positive results for some of the blank samples, but they also mentioned leakage or overflow of the sample bags during analysis. The data sets from laboratories H and L were therefore excluded from the statistical evaluation of the study.

According to the MVTC interpretation of ISO 16140-2 (doc 2016-028 (GC)) all data from collaborators that found (false) positive results with the blank samples, either by the reference or alternative method, were disregarded for the renewal study as well.

The results obtained with the 11 collaborators kept for interpretation are presented in Table 16 (reference method) and Table 17 (alternative method).

Table 16 - Positive results by the reference method (without collaborators H, I, L, M)

Collaborator	Contamination Level		
	L0	L1	L2
A	0	7	8
B	0	7	8
C	0	7	8
D	0	8	8
E	0	7	8
F	0	8	8
G	0	8	8
J	0	8	8
K	0	8	8
N	0	8	8
O	0	8	8
Total	0	84	88
	P0	P1	P2

Table 17 - Positive results (before and after confirmation) by the alternative method (without collaborators H, I, L, M)

Collaborator	Contamination Level					
	L0		L1		L2	
	Before confirmation	After confirmation	Before confirmation	After confirmation	Before confirmation	After confirmation
A	0	0	7	7	8	8
B	0	0	7	7	8	8
C	0	0	7	7	8	8
D	0	0	8	8	8	8
E	0	0	7	7	8	8
F	0	0	8	8	8	8
G	0	0	8	8	8	8
J	0	0	8	8	8	8
K	0	0	8	8	8	8
N	0	0	8	8	8	8
O	0	0	8	8	8	8
Total	0	0	84	84	88	88
	P0	CPO	P1	CP1	P2	CP2

4.4. Calculation of the specificity (SP)

The percentage specificity (SP) of the reference method and of the alternative method, using the data after confirmation, based on the results of level L0 is given in Table 18.

Table 18 - Percentage specificity

Specificity for the reference method	$SP_{ref} = \left(1 - \left(\frac{P_0}{N_-}\right)\right) \times 100 \% =$	100 %
Specificity for the alternative method	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-}\right)\right) \times 100 \% =$	100 %

N. number of all L0 tests

P₀ total number of false-positive results obtained with the blank samples, for the reference method

CP₀ total number of false-positive results obtained with the blank samples, for the alternative method after confirmation

4.5. Calculation of the sensitivity (SEalt, SEref), the relative trueness (RT) and the false positive ratio for the alternative method (FPR)

Fractional positive results were obtained for the low inoculation level (L1) only. This inoculation level was retained for calculations.

A summary of the results of the collaborators retained for interpretation, and obtained with the reference and the alternative methods for Level 1 is provided in Table 19.

Table 19 - Summary of the obtained results with the reference method and the alternative method for Level 1

Response	Reference method positive (R+)	Reference method negative (R-)
Alternative method positive (A+)	Positive agreement (A+/R+) PA = 84	Positive deviation (R-/A+) PD = 0
Alternative method negative (A-)	Negative deviation (A-/R+) ND = 0	Negative agreement (A-/R-) NA = 4

Based on the data summarized in Table 19, the values of sensitivity of the alternative and reference methods, as well as the relative trueness and false positive ratio for the alternative method taking account the confirmations, are given in Table 20.

Table 20 - Sensitivity, relative trueness and false positive ratio percentages

		Level 1
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA+PD)}{(PA+PD+ND)} \times 100\% =$	100%
Sensitivity for the reference method	$SE_{ref} = \frac{(PA+ND)}{(PA+PD+ND)} \times 100\% =$	100%
Relative trueness	$RT = \frac{(PA+NA)}{N} \times 100\% =$	100%
False positive ratio for the alternative method	$FPR = \frac{FP}{NA} \times 100\% =$	0%

4.6. Interpretation of data

No negative deviations or positive deviations were seen in the results of the 11 collaborators retained for interpretation.

For a paired study design, the difference between (ND – PD) and the addition (ND + PD) are calculated for the level(s) where fractional recovery is obtained (in this study L1 only). The observed value found for (ND – PD) and (ND + PD) shall not be higher than the AL. The interpretation of the data (11 collaborators) is given in Table 21.

Table 21 – Interpretation of the interlaboratory study results

Level	Negative Deviations (ND ¹)	Positive deviations (PD)	ND-PD	Acceptability Limit (AL)	ND+PD	Acceptability Limit (AL)
L1	0	0	0	4	0	4

¹ ND including PPND

4.7. Conclusion Interlaboratory Study

The observed values for ND-PD and ND+PD (inoculation level L1, 11 collaborators) meet the acceptability limits (observed values \leq AL).

4.8. Evaluation of the RLOD between laboratories

The RLOD was calculated using the EN ISO 16140-2:2016 Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 06.07.2015). The results are for information only (see Table 22).

Table 22 – RLOD calculations interlaboratory study data 11 laboratories

Name	RLOD	RLODL	RLODU	b=ln(RLOD)	sd(b)	z-Test statist	p-value
all 11 labs, 3 levels	1,000	0,661	1,512	0,000	0,207	0,000	1,000

5. Overall Conclusions Validation Study

The conclusions for the **Method Comparison Study** are:

On the **foodproof® *Salmonella* Detection Kits** (BIOTECON Diagnostics Cat. No. R 310 27 and R 302 27),

- In combination with the **foodproof® StarPrep One Kit** for manual DNA extraction:
 - o The observed values for ND-PD and ND+PD for the 4 individual categories (Infant formula and infant cereals, Probiotics containing products, Ingredients, Environmental samples) and for all categories meet the acceptability limits (observed values \leq AL).
 - o The RLOD values (using the confirmed alternative method results) meet the acceptability limit, which is 1,5 for paired studies, for both categories tested.
 - o The alternative *Salmonella* detection method is selective and specific.
- In combination with the **foodproof® Magnetic Preparation Kit IV** for automated DNA extraction:
 - o The observed values for ND-PD and ND+PD for the restricted 2 individual categories (Infant formula and infant cereals, and Probiotics containing products with the specific protocol P2 for sub-cultivation) and for both categories meet the acceptability limits (observed values \leq AL).
 - o The RLOD values (using the confirmed alternative method results) meet the acceptability limit, which is 1,5 for paired studies, for both categories tested.
 - o The alternative *Salmonella* detection method is selective and specific.

The conclusion for the **Interlaboratory Study** is:

- o The observed values for ND-PD and ND+PD (inoculation level L1, 11 collaborators) meet the acceptability limits (observed values \leq AL).

The overall conclusions of the validation study are:

The alternative method **foodproof® *Salmonella* Detection Kit** (Hybridization probes and 5'Nuclease), using the **foodproof® StarPrep One Kit** for manual DNA extraction, shows comparable performance to the reference method ISO 6579-1:2017 for the detection of *Salmonella* in Infant formula and infant cereals, Probiotics containing products, Ingredients, and Environmental samples.

The alternative method **foodproof® *Salmonella* Detection Kit** (Hybridization probes and 5'Nuclease), using the **foodproof® Magnetic Preparation Kit IV** for automated DNA extraction, shows comparable performance to the reference method ISO 6579-1:2017 for the detection of *Salmonella* in Infant formula and infant cereals, and in Probiotics containing products.

The scope for the **foodproof® Magnetic Preparation Kit IV** for automated DNA extraction is **restricted** to Infant formula and infant cereals, and Probiotics containing products, the latter needing the specific sub-cultivation protocol (second BPW for 20 h at 37°C).

The overview on the claims for the current LR39 is given in the Table below:

Detection of *Salmonella*

Enrichment	Standard protocol: 100 g sample material* plus 900 ml BPW pre-warmed at 37 °C, 16 - 20 h at 37 °C ± 1 °C									
Subcultivation	Standard protocol P1: 100 µl of BPW culture in 900 µl BPW, 3 - 4 h at 37 °C ± 1 °C (shaking at 900 U/min)									
	Specific protocol P2: 100 µl of BPW culture in 900 µl BPW, 20 - 24 h at 37 °C ± 1 °C (shaking at 900 U/min)

Annex C. Sample preparations and enrichment protocols

The following tables show the sample preparation and pre-enrichment protocols for the 4 Categories and their Types of samples.

General remarks:

BPW, pre-heated at 37°C, at the time of sample preparation.

All samples: 100 gram samples, unless otherwise stated.

Unless otherwise stated sample preparations are according to ISO 6887-5 for the dry infant formula products. This reads: In order to dissolve the sample, swirl slowly to wet the powder, then manually shake the bottle, e.g. 25 times, with a movement of about 300 mm, for about 7 s.

Alternatively, a peristaltic blender may be used. Allow to stand for 5 min, shaking occasionally.

Table C-1 Category: Infant Formula and infant cereals.

Sample Type	Sample preparation	Pre-enrichment
Infant Formula (intended for infants < 1 year)	BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Infant Formula (intended for infants > 1 year)	BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Infant cereals	BPW + alpha-amylase (alpha-amylase at 50 mg per 100 gram sample in 900 ml BPW for products with high starch content)	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C

Table C-2 Category: Probiotics containing products.

Sample Type	Sample preparation	Pre-enrichment
Infant formula containing probiotics (<i>L. paracasei</i> , <i>L. rhamnosa</i> , <i>L. reuteri</i>) at a level < 10 ⁸ cfu/g (consumer products)	BPW	Incubation 18 h ± 2 h at 37°C ± 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h and 20 h at 37°C ± 1°C
Infant formula containing probiotics (<i>L. johnsonii</i> , <i>S. thermophilus</i> , <i>B. lactis</i> , <i>B. longum</i>) at a level < 10 ⁸ cfu/g (consumer products)	BPW plus vancomycin (vancomycin at 10 mg/l)	Incubation 18 h ± 2 h at 37°C ± 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h and 20 h at 37°C ± 1°C
Infant cereals containing probiotics (<i>Bifidus</i> bacteria) at a level < 10 ⁸ cfu/g (consumer products)	BPW plus vancomycin and alpha-amylase (vancomycin at 10 mg/l) (alpha-amylase at 50 mg per 100 gram sample in 900 ml BPW for products with high starch content)	Incubation 18 h ± 2 h at 37°C ± 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h and 20 h at 37°C ± 1°C
Culture powders / Preblends containing <i>L. reuteri</i> at ~10 ¹⁰ cfu/g	double strength BPW	Incubation 18 h ± 2 h at 37°C ± 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h and 20 h at 37°C ± 1°C
Culture powders / Preblends containing <i>L. rhamnosa</i> and <i>B. longum</i> at ~10 ¹⁰ cfu/g	double strength BPW plus vancomycin (vancomycin at 10 mg/l)	Incubation 18 h ± 2 h at 37°C ± 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h and 20 h at 37°C ± 1°C

Table C-3 Category: Ingredients.

Sample Type	Sample preparation	Pre-enrichment
Standard PIF ingredients (e.g. milk cow powder, whey cow powder, lactose, maltodextrine)	BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Infant cereals ingredients (e.g. starch, oatmeal, rye meal, wheat (flour), buckwheat)	BPW plus alpha-amylase (alpha-amylase at 50 mg per 100 gram sample in 900 ml BPW for products with high starch content)	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Premix, Duomix (containing minerals, vitamins)	12,5 gram in 900 BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C

Table C-4 Category: Environmental samples.

Sample Type	Sample preparation	Pre-enrichment
Sweep samples/equipment swabs	Submerge swab/sponge in 90 ml BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Traject samples (in-line factory)	BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C
Vacuum cleaner residues	BPW	Incubation 18 h \pm 2 h at 37°C \pm 1°C, followed by 100 µl cultured pre-enrichment in 900 µl fresh BPW Incubation (shaking) 3 h at 37°C \pm 1°C

The following abbreviations are used (e.g. also in Annex L on the raw sensitivity data) to indicate the various different sample preparations:

AA Alpha-amylase added to initial BPW (at 50 mg per 100 gram sample)

BV Vancomycin added to initial BPW (at 10 mg/l)

D Double-concentrated BPW

DV Double-concentrated BPW plus vancomycin (at 10 mg/l)

12,5 12,5 gram sample in 900 ml BPW

90 90 ml BPW (swab/sponge-type samples)

Annex D-J. Kit Inserts

For practical reasons, Kit inserts will be only available as separate pdf's.
All kit inserts will also be available on the website of BIOTECON Diagnostics:
www.bc-diagnostics.com

Annex D*: Kit insert reagent D (BIOTECON Diagnostics Cat. No. A 500 02; version 3, April 2018).

Annex E*: Kit insert **foodproof® StarPrep One Kit** (BIOTECON Diagnostics Cat. No. S 400 07; version 6, November 2018).

Annex F*: Kit insert **foodproof® Magnetic Preparation Kit IV** (BIOTECON Diagnostics Cat. No. S 400 15; version 1, August 2014).

Annex G*: Kit insert EBES test kit A: **foodproof® Enterobacteriaceae plus Cronobacter** Detection Kit - Hybridization probes - (BIOTECON Diagnostics Cat. No. R 310 15.1; version 5, October 2018, as updated according to MicroVal rules).

Annex H*: Kit insert EBES test kit B: **foodproof® Enterobacteriaceae plus Cronobacter** Detection Kit - 5'Nuclease - (BIOTECON Diagnostics Cat. No. R 302 15.1; version 3, November 2018, as updated according to MicroVal rules).

Annex I: Kit insert S test kit A: **foodproof® Salmonella** Detection Kit - Hybridization probes - (BIOTECON Diagnostics Cat. No. R 310 27; version 5, October 2018, as updated according to MicroVal rules).

Annex J: Kit insert S test kit B: **foodproof® Salmonella** Detection Kit – 5'Nuclease - (BIOTECON Diagnostics Cat. No. R 302 27; version 5, November 2018, as updated according to MicroVal rules).

*: Identical Annex for both the LR 39 and the LR 8/9/19/20 studies.

Annex K. Artificial inoculation of test samples

Data summary: number of positive samples/total number of samples (per level)

Annex N. POD-LOD calculations

(for information only)

Example of the spreadsheet results :

POD-LOD calculation program, version 7, dated 2016-03-01

This Excel program is distributed in the hope that it will be useful, but without any warranty.
It can be downloaded at: www.wiwiiss.fu-berlin.de/fachbereich/wiwiis/ehemalige/wilrich/index.html where you can also subscribe to a newsletter informing about available updates.

How to use this program (Macros have to be enabled):

1. Enter the sample size, the total no. of matrices (up to 16) and the maximum no. of contamination levels for any of the matrices (up to 50) into the yellow cells. ► The appropriate no. of tables for your input data will be generated automatically below.
2. Enter your data into the yellow cells of the tables generated according to step 1.
3. Press 'Ctrl+b' to start the calculation. ► The results will be shown in green cells (also next to the input tables). Figures for the estimated probability of detection for each matrix and the combined results are shown in the sheets next to this sheet.
4. You can change the no. of matrices or levels in cell B23 or B24 at any time.
5. You can also change the data in the input tables and re-calculate with 'Ctrl+b'.

Examples corresponding to those in the publication are given in the sheets 'Example' and following. Further information on the underlying equations and the scope and application of this program can be found in the sheet 'Equations Info'.

Name of experiment:	Salmonella - PIF - Ref
Date of experiment:	
Sample size A_c in g or ml:	100
Total no. of matrices:	1
Max. no. of contamination levels:	2
No. of matrix:	1
Name of matrix/sample reference:	ref method
Level of inoculum in cfu/g or cfu/ml	No. of inoculated tubes No. of positive tubes
d	n y
1,0	20 17
10,0	5 5

Results of the POD-LOD calculation

For details see: Wilrich & Wilrich, Journal of AOAC International, Vol. 92, No. 6, 2009, 1763-1772.
¹ LOD_{50%} = 50% Limit of detection, ² LOD_{95%} = 95% Limit of detection

No. of matrix i	Name of matrix $matrix_i$	Matrix effect F_i	SD of log matrix effect s_e	Detection limit $d_{0.5L}$	LOD _{50%} ¹		LOD _{95%} ²		statistic matrix effect $ z_i $
					conf. limit $d_{0.5L_U}$	conf. limit $d_{0.5L_L}$	Detection limit $d_{0.95L}$	conf. limit $d_{0.95L_U}$	
1	ref method	0,019	0,281	0,365	0,208	0,640	1,579	0,901	2,768 0,000

Results for Salmonella PCR between brackets, this would not have been tested during standard routine testing because the EB PCR was already negative

Negative result for an inoculated sample, but consistent result for reference method and alternative method

Unexpected positive result for Salmonella PCR, but would not have been tested during standard routine testing (EB PCR-negative)

Presumptive positive result by alternative method but non-confirmed by culture

Positive result reference method for a non-inoculated sample, inconsistent with the alternative method result

Positive result reference method for a non-inoculated sample, but consistent with the alternative method result
