Summary Report

for the ISO 16140-2 validation of
Salmo*fast* PCR method
for the detection of *Salmonella* spp. in broad range of food products (excluding raw poultry) and production environmental samples (excluding dust)

MicroVal study number	**2023LR125**
Method/Kit names	**Salmo*fast* PCR method**
Report version	**MCS & ILS Report – version 1** 02 March 2026
Manufacturer	**Microbial Systems S.L.** Pic de Peguera 15, Parc Científic i Tecnològic de Girona, Edifici Jaume Casademont E, 17003 Girona (Spain)
MicroVal Expert Laboratory	**ADRIA** ZA Creac'h Gwen F-29000 Quimper (France)

This report consists of 130 pages, including 8 appendices.
Only copies including the totality of this report are authorised.

The results in this report relate only to the item(s) submitted for testing.
Competencies of the laboratory are certified by COFRAC accreditation for the analyses marked with the symbol◆.

Standardized report - Qualitative methods

MICROVAL® NEN

Foreword

The technical protocol and the result interpretation were carried out according to the ISO 16140-2:2016, ISO 16140-2/A1:2024 and the MicroVal technical rules.

Validation protocols	▪ ISO 16140-1:2016 - Microbiology of the food chain - Method validation - *Part 1: Vocabulary* ▪ ISO 16140-2:2016 & ISO 16140-2/A1:2024 - Microbiology of the food chain - Method validation - *Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method* ▪ MicroVal Technical Committee interpretation of ISO 16140-2 v.2.6.
Reference method♦	▪ ISO 6579-1: 2017 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* -Part 1: Detection of *Salmonella* spp. *Annex D was not carried out during the validation study.* ▪ ISO 6579-1/A1:2020 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of Salmonella spp. - Part 1: detection of *Salmonella* spp. Amendment 1: Broader range of incubation temperatures, amendment to the status of Annex D, and correction of the composition of MSRV and SC
Alternative method	**Salmo*fast* PCR method**
Scope	> **Broad range of food products (excluding raw poultry) – up to 25g** > **Production environmental samples (excluding dust) – up to 25g or ml or sampling devices**
Certification organism	Lloyd's Register

♦ Analyses performed according to the COFRAC accreditation (Accreditation Testing n°1-0144, scope available on www.cofrac.fr)

LIST OF ABBREVIATIONS

Method & protocol	
CFU	Colony Forming Units
DW	Deep Well
IAC	Internal Amplification Control
ILS	Interlaboratory Study
MCS	Method Comparison Study
Novo	Novobiocin
RLOD	Relative Level of Detection
RT	Relative Trueness
RTC	Ready to cook
RTE	Ready to eat
RTRH	Ready to reheat
SE	Relative Sensitivity
SP	Relative Specificity
QS5	QuantStudio 5
Interpretation	
AL	Acceptability Limit
alt	Alternative method
$\overline{D}$	Average difference
FN	False Negative results
FNR	False Negative Ratio
FP	False Positive results
FPR	False Positive Ratio
LOD	Limit of Detection
NA	Negative agreement
$NA_{FN\ (alt)}$	Negative Agreement due to false negative alternative-method results
ND	Negative Deviation
$ND_{FN\ (alt)}$	Negative Deviation due to false negative alternative-method results
PA	Positive Agreement
$PA_{FP\ (alt)}$	Positive Agreement due to false positive alternative-method results
PD	Positive deviation
$PD_{FP\ (alt)}$	Positive Deviation due to false positive alternative-method results
ref	Reference method
TNA	Total Negative Agreement
TND	Total Negative Deviation
Raw data	
-A	No typical colonies but presence of high level of background microflora
-B	No typical colonies but presence of medium level of background microflora
-C	No typical colonies but presence of low level of background microflora
(x)	Number of colonies in the plate
*	Dilution of the extract in case of inhibition according to the alternative protocol (1/10)
**	Dilution of the extract in case of inhibition according to the alternative protocol (1/100)
1/2	50% level of target analyte
at	Atypical curve
d	Doubtful result
i	Inhibition
ne	New DNA extraction
NC	Non-characteristic colony
ni	Not isolated colony
m	Minority level of target analyte
M	Majority level of target analyte
p	Pure culture level of target analyte
st	Plate without any colony
w	Weak reaction
Bold typing	**Artificially inoculated samples**

1 INTRODUCTION

In this project, a MicroVal validation study, based on ISO 16140-2 (2016) & ISO 16140-2/A1 (2024), of alternative method, the **Salmo*fast* PCR method** from Microbial Systems S.L. for the detection of *Salmonella* spp. in broad range of food products, and production environmental samples was carried out by ADRIA as the MicroVal Expert laboratory.

The following protocol is concerned by this validation study:

- Two enrichment protocols are available depending on the tested items: Enrichment step in Buffered peptone water supplemented or not with novobiocin (20 mg/L) incubated for 16-20 h at 34-38°C
- DNA extraction using DNA ready reagent.
- PCR using the **Salmo*fast* PCR kit**
- Confirmation by direct streaking onto selective agar plates and performing a latex test on isolated typical colonies or using the tests described in the ISO 6579-1 method.

The reference method used is:

- ISO 6579-1: 2017 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* - Part 1: detection of *Salmonella* spp.
- ISO 6579-1/A1:2020 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* spp. - Part 1: detection of *Salmonella* spp. Amendment 1: Broader range of incubation temperatures, amendment to the status of Annex D, and correction of the composition of MSRV and SC.

Three thermocyclers were included in the validation:

- QS5 from Thermo Fisher Scientific
- CFX96 standard from Bio-Rad
- CFX Opus DW from Bio-Rad.

The 6 categories included are:

- Raw, RTC, RTE and RTRH meat products (excluding raw poultry)
- Raw and heat-processed milk and dairy products
- Fresh produces and fruits
- Multicomponent foods or meal components
- Raw and RTC fish and seafood
- Production environmental samples (excluding dust).

Four criteria are evaluated during the validation study according to the ISO 16140-2:2016 & ISO 16140-2/A1:2024:

- Method comparison study
  - Sensitivity study,
  - Relative level of detection study,
  - Inclusivity / Exclusivity,
- Inter-laboratory study.

2 METHOD PROTOCOLS

The Method Comparison Study was carried out using 25 gram portions of sample material.

2.1 Reference method♦

See the flow diagram in **Appendix 1**.

Sample preparations used in the reference method and the alternative method were done according to ISO 6887-series.

♦ Analyses performed according to the COFRAC accreditation (Accreditation Testing n°1-0144, scope available on www.cofrac.fr)

The reference method used for this study was the following:

- ISO 6579-1: 2017 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* spp. - Part 1: detection of *Salmonella* spp.
- ISO 6579-1/A1:2020 - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* spp. - Part 1: detection of *Salmonella* spp. Amendment 1: Broader range of incubation temperatures, amendment to the status of Annex D, and correction of the composition of MSRV and SC.

2.2 Alternative method

2.2.1 Principle

Salmo*fast*® has been specifically designed to provide a simple and reliable method for detecting the presence of *Salmonella* in various samples by real-time PCR. The kit contains all the necessary components to perform PCR amplification and detection: master mix including primers and probes and an internal control, and positive and negative controls for quality assurance. This user-friendly kit allows for accurate and sensitive detection of *Salmonella* in a variety of sample types, including food, water, and environmental swabs.

2.2.2 Protocol

See the flow diagram of the alternative method in **Appendix 2**.

See attached the kit instruction in **Appendix 3**: Instrucciones Salmofast_v20.pdf.

The different steps are the following:

- Enrichment in BPW for all food products (except raw poultry, raw dairy, raw fish and seafood) and production environmental samples.
- BPW + novobiocin (20 mg/L) for raw dairy, raw fish and seafood for 16-20 h at 34-38°C.
- The preparation of the samples is performed according to the ISO 6887 parts.

- Lysis step: 55 µL of enriched sample + 55 µL DNA ready, heat treatment for 56°C 10 min, 95°C 15 min, 25°C 10 min. Centrifugation for 1 min between 2000 and 4000g.
- PCR on 5µL of DNA extract + 15 µL mix PCR with the Salmo*fast* kit using QS5 from Thermo Fisher Scientific or CFX96 standard or CFX Opus DW from Bio-Rad.
- Confirmation by:
    - Direct streaking onto XLD and Oxoid™ Brilliance™ *Salmonella*. The typical colonies are confirmed by Thermo Scientific *Salmonella* Latex Agglutination or test from the ISO 6579-1 method (serological test and biochemical gallery) on well isolated colonies.
    - ISO 6579-1 test: subculture RVS and MKTTn before streaking onto XLD and a second selective agar plate. The typical colonies are confirmed biochemical and serological test.

It is possible to store the enriched samples for 72 h at 5°C ± 3°C before performing the lysis step and confirmatory tests.
In case of PCR inhibition, the following strategy can be applied: extract can be diluted 1/10 in water.

2.2.3 Restriction

Based on results obtained during the MCS study, dust and raw poultry meat samples were excluded from the scope of the method.

For dust samples, a total of 12 samples were evaluated (10 positive and 2 negative). The analysis showed a high level of interference, with 33% inhibition and two false-negative results. It is suspected that the high particle contents in these samples negatively impacted PCR performance. Following discussions with the manufacturer and considering the limited interest in testing this type of product in the field, it was decided to remove dust samples from the scope of the method.

Regarding raw poultry meat, a high number of negative deviations was obtained when testing this type of product using the BPW + novobiocin protocol (ND= 5; TND-PD = 4). As a result, this matrix was also excluded from the scope. Additional investigations conducted by Microbial suggested that the novobiocin protocol is not suitable for poultry products, as it does not effectively suppress the specific microbiota associated with this matrix. Consequently, *Salmonella* spp. may not grow sufficiently to reach the detection threshold required for both PCR and plating methods.

Moreover, several studies have documented the prevalence of antimicrobial resistance in poultry microbiota, often showing higher resistance levels compared to other meats—largely attributed to intensive antibiotic use in poultry farming (Grobbel et al., 2022; Johnson et al., 2017; Hedman et al., 2020). These findings, in conjunction with Microbial observations, suggest that the poor performance observed is likely due to the limited effectiveness of novobiocin in this specific food matrix.

2.3 Study design

The study is **a paired study design** when BPW is used for the enrichment step of the alternative method, as the reference and the alternative methods have the same enrichment procedure.

The study is **an unpaired study design** when BPW + novobiocin is used for the enrichment step of the alternative method (addition of the novobiocin supplement), as the reference and the alternative methods have different enrichment procedures.

3 METHOD COMPARISON STUDY

3.1 Sensitivity study

The sensitivity (SE) is the ability of the method to detect the analyte by either the reference or alternative method.

3.1.1 Categories and sample types

Five food categories, and one production environmental samples category were included in this validation study with a total of **390 samples** analysed. A minimum of 60 items for each category were tested by both the reference method and the alternative method in the sensitivity study, with a minimum of 30 positive samples per category. Each category was made up of 3 types, with at least 20 items representative for each type.
The distribution per tested category and type is given in Table 1. Positive results were considered if being found positives confirmed with at least one of the tested methods (reference or one of the alternative protocols).

Table 1 - Categories, types and number of samples

Category		Type		Alternative method protocol	Positive samples	Negative samples	Total
1	Raw, RTC, RTE and RTRH meat products (excluding raw poultry) (combined)	a	RTE and RTRH meats	BPW	13	8	21
		b	Raw and RTC meat (except poultry)	BPW	14	11	25
		c	Raw meat delicatessen	BPW	11	11	22
			Total		38	30	68
2	Raw and heat-processed milk and dairy products Combined	a	Raw milk-based products	BPW + novobiocin	12	8	20
		b	Pasteurized milk products	BPW	12	13	25
		c	Milk powders	BPW	8	12	20
			Total		32	33	65
3	Fresh produce and fruits	a	Raw vegetables	BPW	11	11	22
		b	Raw fruits	BPW	10	11	21
		c	Sprouts	BPW	11	9	20
			Total		32	31	63
4	Multicomponent foods or meal components	a	Composite foods with substantial raw ingredients (excluding patisseries)	BPW	10	10	20
		b	Ready to eat and reheat foods refrigerated	BPW	14	10	24
		c	Ready to eat and reheat foods frozen	BPW	8	12	20
			Total		32	32	64
5	Raw and RTC fish and seafood	a	Raw fish	BPW + novobiocin	13	10	23
		b	Raw seafood	BPW + novobiocin	12	10	22
		c	Ready to cook fish and seafood (processed)	BPW	11	10	21
			Total		36	30	66
6	Production environmental samples (excluding dust)	a	Surfaces (swabs, sponges, wipes)	BPW	11	12	23
		b	Waste and residues	BPW	8	12	20
		c	Process water	BPW	12	9	21
			Total		31	33	64
Total					**201**	**189**	**390**

3.1.2 Test sample preparation

Naturally contaminated samples were preferentially analyzed. A total of 96 samples were tested uncontaminated. Six samples were found positive with four originated from meat and two linked to meat industry (multicompnent with meat or process water with meat).

Due to the low level of natural contamination, artificial contaminations were required. They were obtained by:

- **Spiking** with injured cells after heat treatment
- **Seeding** by direct inoculations of high moisture matrices using liquid cell suspensions, followed by storage periods of 48-72 h at 5 ± 3°C or 1 to 2 weeks at -20°C. For low moisture products, lyophilized strains were used for inoculation and, the samples were stored for 2 weeks at ambient temperature before analysis.

When spiking the strains were stressed using various injury protocols. The injury efficiency was evaluated by comparing enumeration results onto selective and non-selective agars (respectively PCA and XLD). The artificial contaminations are presented in **Appendix 4**.

The same strain was not used to inoculate more than 6 samples.

Twenty-two samples were artificially contaminated by *spiking* after a heat treatment between 10 and 12 min at 56°C, using 10 different strains. Eighteen gave a positive result. All the spiking inoculations, after injury protocols on the inoculum, were lower or equal to 5 CFU/sample.

272 samples were artificially contaminated by *seeding*, using 88 different strains and three seeding protocols (liquid at 5 ± 3°C or frozen -20°C or lyophilized). 177 gave a positive result. Most of the seeding inoculations were lower or equal to 5 CFU/sample.

The repartition of the positive samples per inoculation protocol and inoculation level is given in Table 2.

Table 2 - Repartition of the positive samples per inoculation protocol and inoculation level

	Naturally contaminated	Artificial contamination				Total
		Seeding protocol		Spiking protocol		
		≤ 3 CFU	3 < x ≤ 10 CFU	≤ 5 CFU	5 < x ≤ 10 CFU	
Number of positive samples	6	172	5	18	0	201
%	3.0%	85.6%	2.5%	9.0%	0.0%	100.0%

3.0% of the samples were naturally contaminated. A large majority of the positive samples were tested with an artificial contamination at low level of inoculation (below 3 or 5 CFU/test portion).

3.1.3 Protocols applied during the validation study

> *Incubation times*

The minimum incubation time was applied for the enrichment step: 16 h at 37 ± 1°C and the two enrichment protocols were evaluated depending on the categories and type tested as described in Table 1.

> PCR

All samples were tested on the three thermocyclers and interpretation was made using their associated software and following Salmo*fast*® IFU – Annex 1:

- QS5 from Thermo Fisher Scientific with the QuantStudio™ Design & Analysis v.1.5.2
- CFX 96 standard from Bio-Rad with CFX Manager™ Software v 3.1
- CFX Opus DW from Bio-Rad with CFX Manager™ Software v 3.1

Different channels are used depending on the thermocycler: Cy5 and VIC for QS5 and Cy5 and HEX for CFX 96 standard and CFX OPUS DW.

Interpretations are made according to the kit insert as follow:

- For QS5, the threshold is automatically given by the software and a cut off at 39 is applied manually.
- For CFX96 and Opus, the analysis is done manually by determining the threshold based on the maximum RFU of the positive control for the Cy5 channel or of the negative control for the HEX channel:
    - If the threshold of the automatically is placed above the 10% of the maximum RFU, no modification is applied
    - If not, the threshold is manually adjusted at 10% of the maximum RFU

A positive result is obtained when an amplification is obtained in the Cy5 channel (Cq value available). For CFX96 and CFX Opus Deepwell, curves showing a low sigmoidal shape below the threshold must be considered as potentially positive. The end user must proceed to confirmation.

A negative result is obtained when no amplification is observed in the Cy5 channel, and an amplification is observed in the VIC or HEX channel with a Cq not greater than 3 Cq units compared to the NTC. If more than 3 Cq or no amplification is observed in the VIC/HEX channel and no amplification is observed on the Cy5 channel, the sample should be considered as inhibited.
In case of PCR inhibition, the extract was diluted 1/10 in water and tested again.

As the CFX Opus was not included at the beginning of the study, it was agreed with the technical committee to use frozen DNA extracts generated previously to complete the dataset for this instrument.

> ***Confirmation***

For the purpose of the validation, all the samples were confirmed by direct streaking onto XLD and Oxoid™ Brilliance™ Salmonella and following ISO 6579-1 (subculture in RVS and MKTTn and streaking into XLD and a chromogenic media). The typical colonies will be confirmed by Thermo Scientific Salmonella Latex Agglutination and test from the ISO 6579-1 method (serological test and biochemical gallery).

> ***Enrichment broths storage for 72 h at 5°C ± 3°C***

The enrichment broths from positive and discordant samples were stored for 72 h at 5°C ± 3°C and the PCR was tested again. Storage for 72h at 5°C ± 3 °C is a possibility offered in the ISO 6579-1 method, the confirmatory tests were thus not tested again except for samples enriched in BPW + novobiocin and in case of change is observed between both PCR results (before / after storage).

3.1.4 Sensitivity study results

All raw data per category are given in **Appendix 5**. Sample numbers in **bold** indicate artificial inoculation of the sample.

Table 3 shows the summary of results of the reference method and the alternative methods for **all Categories**.

Table 3 – Summary of sensitivity study results – *all categories and protocols*

		Reference method positive (R+)	Reference method negative (R-)
QS5	Alternative method positive (A+)	Positive agreement (R+/A+) **PA= 177**	Positive deviation (R-/A+) **PD= 10**
	Alternative method negative (A-)	Total Negative deviation (R+/A-) **TND= 12** **(with $ND_{FN(alt)}$= 5 and $PA_{FP(alt)}$= 1)**	Total Negative agreement (R-/A-) **TNA= 191** **(with $NA_{FN(alt)}$= 2 and $PD_{FP(alt)}$= 12)**

With $TND = ND + ND_{FN\,(alt)} + PA_{FP\,(alt)}$ $TNA = NA + NA_{FN\,(alt)} + PD_{FP\,(alt)}$

3.1.5 Sensitivity study calculations

The sensitivity study parameters as specified in Table 4 were calculated for all categories and types, and the overview is given in Table 5.

Table 4 – Formula to calculate the sensitivity parameters – All categories

		QS5	CFX96	CFX Opus DW
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + TND + PD)}\ x\ 100\ \%$	94.0%	94.0%	93.0%
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + TND)}{(PA + TND + PD)}\ x\ 100\ \%$	95.0%	94.0%	94.0%
Relative trueness	$RT = \frac{(PA + TNA)}{N} x100\ \%$	94.4%	93.8%	93.3%
False positive ratio for the alternative method	$FPR = \frac{PA_{FP(alt)} + PD_{FP\,(alt)}}{TNA}\ x\ 100\ \%$	6.8%	9.0%	10.1%
False negative ratio for the alternative method	$FNR = \frac{NA_{FN(alt)} + ND_{FN(alt)}}{PA+TND+PD}\ x\ 100\ \%$	3.5%	2.5%	3.5%

3.1.6 Discordant results

> Negative deviations

Between 12 to 14 total negative deviations (TND) were observed depending on the thermocycler tested, all coming from artificially contaminated samples.

The presence of *Salmonella* spp in the enrichment broth was confirmed for 5 samples with the QS5 and CFX 96 ($ND_{FN(alt)}$ = 5) and for 7 samples with the CFX Opus DW ($ND_{FN(alt)}$ = 7). All of those samples were tested with a paired protocol with 3 of them coming from sprouts type. For 5 of them, no typical colonies or few number of typical colonies (below 10) were observed after direct streaking. Replicate of the PCR was carried on but in most of the cases, negative PCR results were obtained again. However, after storage, four samples became positive with all the thermocycler evaluated.

The samples are listed Table 6.

> Negative agreement (False negative)

According to ISO 16140-2, samples in negative agreement were also evaluated by the confirmation method. For two of them with QS5, the *Salmonella* strain was confirmed in the enriched broth ($NA_{FN(alt)}$). Samples originated from two different categories (1561: Raw cow milk; 253: Process water before cleaning). The DNA extract was tested two additional times and fractional positive results were obtained indicating that the level growth was just at the limit of detection of the method.

The samples are listed Table 7.

> Positive deviations

Between 10 and 12 positive deviations were observed depending on the thermocycler tested, all coming from artificially contaminated samples.
As expected, they concern only samples tested with the unpaired protocol.
Most of the results were consistent between the three thermocyclers. Only two samples showed negative results in some conditions ($NA_{FN(alt)}$).

The samples are listed Table 8.

The analyses of discordant results according to the ISO 16140-2:2016 and ISO 16140-2/A1 for a mixed study is the following (See Table 9).

With the agreement of the technical committee, the calculation of TND+PD for the mixed analysis was not included in the report.

For QS5 and CFX96, the individual category, paired and unpaired protocols and all categories/protocols combined meet the acceptability limits.

For CFX Opus DW, the individual category as well as, the unpaired protocol and all categories/protocol combined met the acceptability limits.

However, the combined paired protocol failed the criteria (TND-PD = 6 for an AL at 5).

A root cause analysis was conducted in order to investigate those differences.

> *Root cause analysis*

Four samples among the 390 samples tested (2.5%) showed a difference in the PCR results between the CFX Opus and at least one of the other cyclers, with all of them being different from the QS5 and 2 in comparison to the CFX96. Three differences concerned the paired protocol This resulted in a TND-PD = 6 for the paired protocol instead of 5 for the other thermocyclers.

They are listed in Table 10.

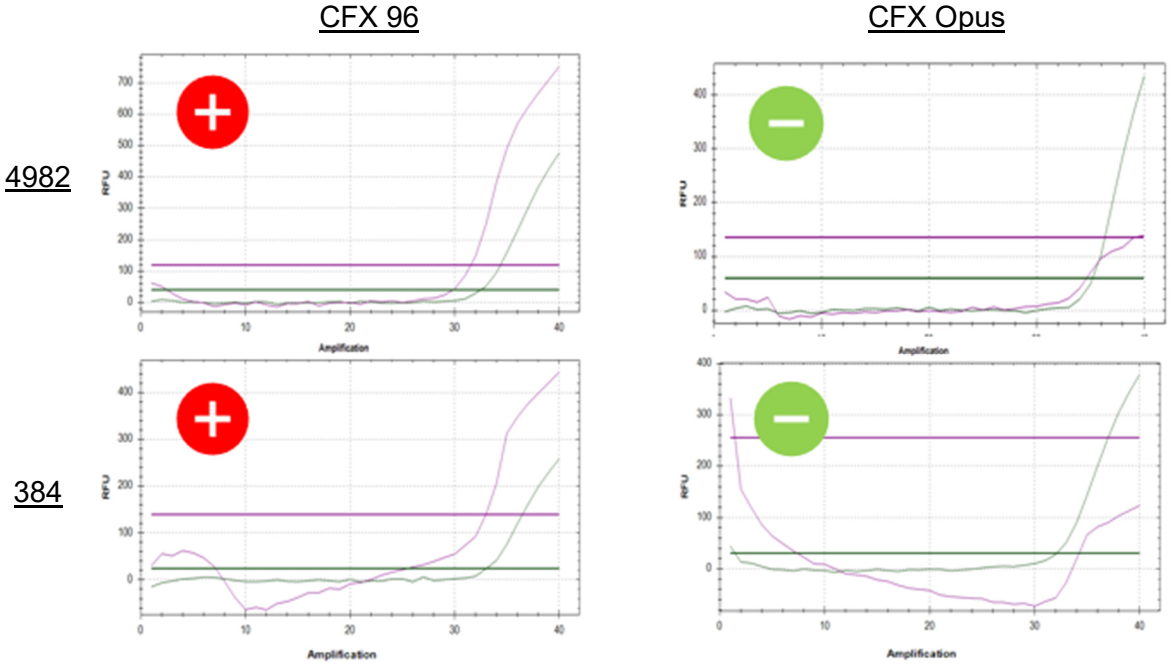
** 1/10 dilution following inhibition during the first assay*

Retest was performed on the two samples found negative using the CFX Opus. Note that, one of them was tested from frozen lysates. The other one was found inhibited during the first testing; therefore, the results was obtained after 1/10 dilution of the sample. After retest, fractional positive results were obtained, suggesting a presence of *Salmonella* at the limit of detection of the method.

Further investigations were conducted on the initial curves obtained using CFX 96 and CFX Opus for those two samples (4982 and 394). The curves are showed in Figure 1 below.

Figure 1- Curves obtained for two samples with different results between CFX 96 and CFX Opus



In both cases, very late positive can be observed. The main differences between cyclers are due to the baseline analysis and threshold positioning, leading to false negative with the CFX Opus. Therefore, in agreement with the technical committee, a warming sentence was added into the IFU in order for the end user to consider low sigmoidal signal below the threshold as potential positive curves and proceed to confirmation for both CFX 96 and CFX Opus.

This phenomenon was not observed on the QS5 probably because of the automated analysis.

The observed values for TND - PD and TND + PD (paired study only) for the individual categories and for all categories meet the acceptability limits (observed values ≤ AL) except for the CFX OPUS DW with the unpaired protocol. This instrument will be kept to the scope of the method with a warning for the end user to consider low sigmoidal signal as potential positive curves.

3.1.7 Enrichment broth storage at 5 ± 3 °C for 72 h

Enrichment broth storage was done at 5°C ± 3°C for 72 h.

219 samples were tested again after enrichment broth storage. The following changes were observed (See Table 11).

Table 11 - Observed changes in results before and after storage of the enrichment broth

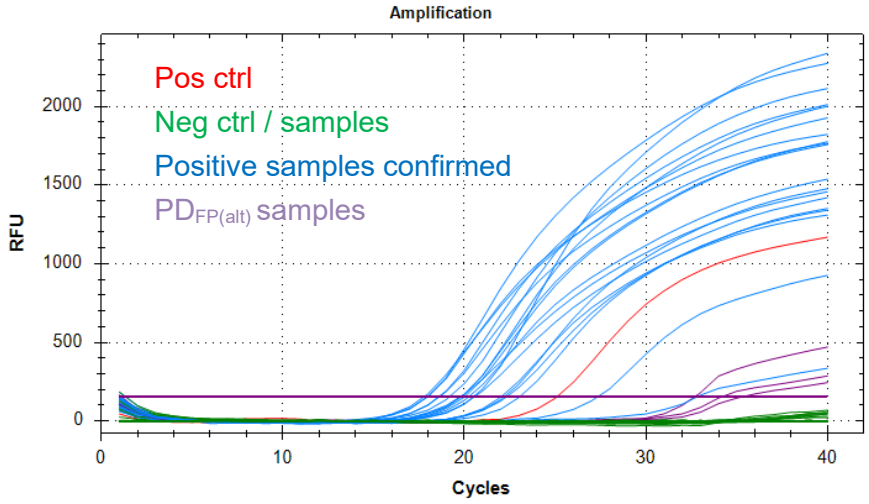
The observed values for TND - PD and TND + PD (paired study only) for the individual categories and for all categories meet the acceptability limits (observed values ≤ AL) after storage of the broth for 72h at 5 ± 3°C

3.1.8 Confirmation

It was impossible to confirm the presence of *Salmonella* spp. in the enrichment broth after incubation time for 12 to 17 samples depending on the cycler tested ($PD_{FP(alt)}$ and $PA_{FP(alt)}$). The higher number of false positive results were obtained with the CFX Opus DW. Some categories seem to create a higher number of false positive results (Raw and ready-to-cook fish and seafood and production environmental samples). Only 4 $PD_{FP(alt)}$ were consistent between all cyclers and most of the false positive results decrease after storage ($PD_{FP(alt)}$ + $PA_{FP(alt)}$= 0 to 2). In many cases, very late positives curves, close to the threshold limit was obtained for those samples as shown in the figure below.

Figure 2 - Examples of PCR curves for $PD_{FP(alt)}$ samples with CFX Opus DW



In the absence of treatment to remove the DNA, the presence of free DNA in the samples could not be investigated.

All samples are presented in Table 13.

3.1.9 PCR inhibition

For this study, 1827 PCR test were performed considering the three thermocycler and the test before and after storage of the enrichment broth. A total 35 PCR inhibitions (1,9% of the PCR results) were observed and concern 17 samples distributed among all categories. A repetition of the testing was carried out after 1/10 dilution and this was sufficient to remove the inhibition except for one sample that required 1/100 dilution (5160: chocolate mousse).

All samples are presented in Table 14.

Table 14 – Inhibited samples

3.2 Relative level of detection

The relative level of detection is the level of detection at P = 0.50 (LOD_{50}) of the alternative (proprietary) method divided by the level of detection at P = 0.50 (LOD_{50}) of the reference method.

The RLOD is defined as the ratio of the alternative and reference methods:

$$RLOD = \frac{LOD_{Alt.}}{LOD_{Ref.}}$$

3.2.1 Categories, sample types and strains

Six (matrix/strain) pairs were analyzed by the reference method and by the alternative method (See Table 15):

Table 15 - List of selected types and strains per category, as tested within the relative level of detection study

Category		Matrix	Strain	Origin	Inoculation and storage condition	Enrichment protocol
1	**Raw, RTC, RTE and RTRH meat products excluding raw poultry (combined)**	Ground beef	*S.* Typhimurium A00C060	Ground beef	Liquid suspension 48-72 h at 3 ± 2°C	BPW
2	**Raw and heat-processed milk and dairy products (combined)**	Raw milk	*S.* Ohio Ad1482	Raw cow milk	Liquid suspension 48-72 h at 3 ± 2°C	BPW + novobiocin
3	**Fruits and vegetables**	Fresh spinach	*S.* Virchow Ad2569	Zucchini	Liquid suspension 48-72 h at 3 ± 2°C	BPW
4	**Multicomponent foods or meal components**	Spanish Tortilla (eggs, potatoes, onions)	*S.* Havana Ad1728	Liquid egg product	Spiking after heat-treatment	BPW
5	**Raw and ready-to-cook fish and seafood**	Raw fish filet	*S.* Anatum Ad1451	Fish fillet	Liquid suspension 48-72 h at 3 ± 2°C	BPW + novobiocin
6	**Production environmental samples (excluding dust)**	Stainless steel surface 4"x 4" (sponge used as sampling device)	*S.* Livingstone Ad2702+ co-inoculation with 10 x *Citrobacter freundii* 39	Dairy industry	Liquid inoculum Storage overnight at ambient temperature	BPW

3.2.2 Test sample preparations

Three levels of artificial contamination were prepared for each type:

- Negative control level: one non-inoculated in order to get 5 test portions,
- Low level: one inoculated between 1 and 2 CFU/sample in order to get 20 test portions providing fractional recovery,
- Higher level: one inoculated between 3 and 5 CFU/sample in order to get 5 test portions contaminated at a higher level.

For processed food type, a spiking of the strain after heat-treatment was performed.
For high moisture products, the samples were individually inoculated with the strain suspension and stored for 48-72h at 3°C ± 2°C before analysis.
For stainless stell surface, a liquid inoculum will be spread on the surface and stored overnight before analysis.

A total plate count determination on each matrix will be performed to estimate the total microbial load on the day of analysis (except for stainless steel).

3.2.3 RLOD study results

The tabulated raw data on the RLOD are given in **Appendix 6**.

The RLOD calculations were performed using the Excel spreadsheet available at http://standards.iso.org/iso/16140 - RLOD version 4 (2024-01-10). The RLOD before confirmation are given in Table 16. The RLOD after confirmation are given in Table 17.

Table 16 – Presentation of RLOD before confirmation of the alternative method results

Category	Name: (Strain / matrix) pair	AL	RLOD		
			QS5	CFX96	Opus DW
1	Ground beef S. Typhimurium A00C060	1.5	1.0	0.8	1.0
2	Raw milk S. Ohio Ad1482	2.5	1.0	1.3	1.5

Table 17 – Presentation of RLOD after confirmation of the alternative method results

Category	Name: (Strain / matrix) pair	AL	RLOD		
			QS5	CFX96	Opus DW
1	Ground beef S. Typhimurium A00C060	1.5	1.0	1.0	1.0
2	Raw milk S. Ohio Ad1482	2.5	1.2	1.3	1.5
3	Fresh spinach S.Virchow Ad2569	1.5	1.1	1.0	1.1
4	Tortilla S. Havana Ad1728	1.5	1.1	1.1	1.0
5	Raw fish filet S. Anatum Ad1451	2.5	1.7	1.7	1.7
6	Stainless steel S. Livingstone Ad2702	1.5	1.0	1.0	1.0
Combined		/	**1.2**	**1.2**	**1.1**

The LOD_{50} calculations were done using the Excel spreadsheet available at http://standards.iso.org/iso/16140 POD-LOD calculation program - version 12, 2024-03-05. The tests are given in Table 18.

Table 18 – LOD_{50} results of the reference and alternative method with the different instruments

Category	Name: (Strain / matrix) pair	Level of detection at 50 % (CFU / sample size)			
		Reference method	Alternative method		
			QS5	CFX96	CFX Opus
1	Ground beef S. Typhimurium A00C060	0.5 [0.3 ; 1.0]	0.5 [0.3 ; 1.0]	0.5 [0.3 ; 1.0]	0.5 [0.3 ; 1.0]
2	Raw milk S. Ohio Ad1482	1.1 [0.6 ; 2.0]	1.3 [0.7 ; 2.5]	1.5 [0.8 ; 2.9]	1.8 [0.9 ; 3.6]
3	Fresh spinach S. Virchow Ad2569	0.3 [0.2 ; 0.7]	0.4 [0.2 ; 0.8]	0.3 [0.2 ; 0.7]	0.4 [0.2 ; 0.8]
4	Tortilla S. Havana Ad1728	0.4 [0.2 ; 0.9]	0.5 [0.3 ; 1.0]	0.5 [0.3 ; 1.0]	0.5 [0.3 ; 0.9]
5	Raw fish filet S. Anatum Ad1451	0.6 [0.3 ; 1.0]	1.1 [0.6 ; 2.0]	1.1 [0.6 ; 2.0]	1.1 [0.6 ; 2.0]
6	Stainless steel [1] S. Livingstone Ad2702	/	/	/	/
Combined		**0.6 [0.5 ; 0.8]**	**0.8 [0.6 ; 1.0]**	**0.8 [0.6 ; 1.0]**	**0.8 [0.6 ; 1.0]**

[1] For this matrix, it is not possible to calculate the LOD_{50} as the contamination level do not take into account the die-off of the inoculated strain during the overnight storage

3.2.4 Conclusion

The RLOD values (using the confirmed alternative method results) meet the acceptability limit 2.5 for unpaired studies, for all matrix/strain pairs tested.

The LOD_{50} varies from 0.4 to 1.1 CFU/test portion for the reference method and from 0.3 to 1.8 CFU/test portion for the alternative method.

3.3 Inclusivity / exclusivity

The inclusivity is the ability of the alternative method to detect the target analyte from a wide range of strains. The exclusivity is the lack of interference from a relevant range of non-target strains of the alternative method.

3.3.1 Protocols

Inclusivity

Salmonella strain cultures were performed in BHI medium at 37°C. Dilutions were done in order to inoculate 10 - 100 cells/225 ml of BPW + novobiocin broth. The broth was incubated for 16 h at 37 ± 1°C before performing the alternative method protocol

(PCR and confirmation). Addition of 25 mL of milk into the broth prior to adding the strain and enrichment was performed for some strains to investigate the absence of detection.

> **Exclusivity**

Negative strains cultures were performed in BHI at 37°C. Dilutions were realized in order to inoculate 10^5 cells/ml BPW. The BPW was incubated for 24h at 34 - 38°C. The alternative method was then performed (PCR).

3.3.2 Results

Raw data are given in **Appendix 7**.

> **Inclusivity**

A total of one hundred strains were tested for **inclusivity**. Ninety-six of these strains showed the expected positive result for all three cyclers and confirmation tests. One strain was found positive by PCR on all three cyclers and by direct streaking on XLD, but no growth was observed on Brillance *Salmonella*. Among all the strain growing on XLD, eight didn't have the expected color.

For 3 strains, negative PCR and confirmatory tests were observed:

- *Salmonella Abotusovis* Ad2320
- *Salmonella* Gallinarum biovar pullorum Ad300
- *Salmonella Typhi* Ad302.

Additional investigations were carried on by testing the strain with the addition of milk in the enrichment prior to incubation. All were then found positive by PCR and confirmation.

> **Exclusivity**

A total of 30 strains were tested for **exclusivity**. 29 of these strains showed the expected negative result by PCR and confirmation. 1 strain was found late positive by PCR with the QS5 and the CFX Opus but negative by confirmation. A repetition of the PCR gave negative results.

The alternative *Salmo*fast PCR method detection method is selective and specific.

4 INTER-LABORATORY STUDY

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

4.1 Study organisation

Collaborators number

Samples were sent to 15 laboratories from 3 countries; 2 collaborators were involved in the study for Laboratories B and I.

Matrix and strain used

Raw fish filet (raw salmon filet) was contaminated by a *Salmonella* Anatum Ad1451 strain isolated from seafood.

Samples

Samples were prepared and inoculated on Monday 29th of September 2025, as described below:

- 24 blind coded samples (25 g) for *Salmonella* spp. detection by the ISO 6579-1 reference method.
- 24 blind coded samples (25 g) for *Salmonella* spp. detection by the Salmo*fast* PCR method alternative method.
- 1 sample (labelled “Aerobic mesophilic flora”) for the total viable count microflora enumeration by the ISO 4833-1 (2013).
- 1 water flask labelled “Temperature Control” with a temperature probe.

Inoculation

The targeted inoculation levels were the following:

- Level: 0 CFU/25 g,
- Level 1: 1.0 CFU/25 g, inoculation level providing as much as possible fractional positive recovery data,

- Level 2: 4.0 CFU/25 g.

> *Labelling and shipping*

Blind coded samples were placed in isothermal boxes, which contained cooling blocks, and express-shipped to the different laboratories.

A temperature sensor was added to the package in order to register the temperature profile during the transport, the package delivery and storage until analyses. A temperature control flask with water was also included in the packages, to allow collaborators to verify the temperature upon receipt.

Samples were shipped in 24 h to 48 h to the involved laboratories. The temperature conditions had to stay lower or equal to 8°C during transport, and between 0°C – 8°C in the labs.

> *Analyses*

Collaborative study laboratories and the expert laboratory carried out the analyses with the alternative and reference methods the same day. The collaborators were supposed to start the analyses at Day 1 or Day 2 at the latest: on Tuesday 30th of September or Wednesday1st of October 2025 with the alternative and reference methods.

For the alternative method, the protocol with BPW + novobiocin (20 mg/L) was evaluated.

4.2 Experimental parameters controls

4.2.1 Detection of Salmonella spp. in the matrix before inoculation

In order to ensure the absence of *Salmonella* spp. in the raw fish filet, the reference method was performed on five portions (25 g) before the inoculation. All the results were negative.

4.2.2 Strain stability during transport

Strain stability was checked at ADRIA by inoculating the matrix at 1 000 CFU/g and 1 CFU/ 25g. Enumerations were performed for the high contamination level and detection analyses were performed for the low contamination level after 24 h, 48 h and 72 h storage at 5 ± 3°C. Triplicates were analysed. The mesophilic aerobic flora was also enumerated; the results are given in Table 19.

Table 19 – *Salmonella* spp. sample stability

Day	Detection analyses						Enumeration analyses (onto *Brilliance* Salmonella) CFU/g			Aerobic mesophilic flora - ISO 4833-2 (CFU/g)
	Reference method (ISO 6579-1)			Alternative method (Salmo*fast*®)						
	Sample 1	Sample 2	Sample 3	Sample 1	Sample 2	Sample 3	Sample 1	Sample 2	Sample 3	
Day 0	-	+	+	-	+	+	6.40E+02	1.90E+03	1.60E+03	1.40E+05
Day 1	-	+	+	-	+	+	9.10E+02	2.10E+03	3.60E+03	1.60E+03
Day 2	+	-	+	+	+	+	4.80E+03	1.60E+03	2.30E+03	1.40E+04
Day 3	+	+	+	-	-	+	1.60E+03	2.20E+03	1.20E+03	6.10E+05

No evolution of the detection and the enumeration of *Salmonella* spp. was observed during storage at 5°C ± 3°C nor in the enumeration of the mesophilic flora.

4.2.3 Contamination levels

The contamination levels and the codification of the samples send to the participants were the following (see Table 20).

Table 20 - Contamination levels

Level	Samples	Theoretical target level (CFU/test portion)	True level (CFU/ test portion)	Low limit (CFU/test portion)	High limit (CFU/test portion)
Level 0	2-5-8-9-13-19-20-22 28-30-31-36-39-42-44-47	0.0	/	/	/
Level 1	3-4-7-11-14-16-18-24 25-26-29-33-37-38-43-46	1.0	0.9	0.63	0.97
Level 2	1-6-10-12-15-17-21-23 27-32-34-35-40-41-45-48	4.0	4.3	3.78	4.99

The obtained levels are within the expected range to reach fractional recovery at level 1.

4.2.4 Logistic conditions

The temperatures measured at reception by the collaborators, the temperatures registered by the thermo-probe, and the receipt and analysis dates are given in Table 21.

Table 21 - Sample temperatures at receipt

Collaborator	Temperature measured by the probe (°C)			Temperature measured by the collaborator	Receipt date and time		Analysis date		
	At receipt	Average	[min;max]	At receipt			Day (D=contamination)	Date	Hour
A	2.6°C	3.8°C	[2.0-9.7°C]	3.2°C	30/09/2025	9:30 AM	D+1	30/09/2025	9:30 AM

No problems were encountered during the transport or receipt of samples for 13 collaborators. The samples were delivered on time and in appropriate conditions and the analysis were performed at Day 1 or 2.

Three collaborators (G, K and M) received the samples on time (Day 1 for G and Day 2 for K and M) but temperatures measured by the collaborator on the water flask at receipt were above the acceptability limit fixed at 8.0°C (8.7°C, 11.6°C and 9.1°C). The temperature measured remains lower than 8.0°C for collaborators G and M when

measured by the probe suggesting that the higher temperature measured in the water flask is not relevant.
For collaborator K, the higher temperature measured by the probe was 8.9°C but the probe has registered temperature higher than 8.0°C only for 1h before storage at 5±3°C. This remains acceptable as neither the mesophilic flora nor the *Salmonella* contamination will have time to grow in such condition.

Moreover, the aerobic mesophilic flora of collaborators G, K and M have not evolved (1.7×10^4, 5.7×10^5, 4.1×10^5 CFU/g) compared with the other collaborators. It was decided to keep these collaborators due to the analysis carried out on time, the small increase in the temperature and the low impact of the temperature increased on the recovery of the strain.

One collaborator (N) received the samples on time and in good conditions but did not receive all the media on time. He was able to perform the analyses only on Day 4 and a important increase of the mesophilic flora was observed. This set of data was not taken into account for the final interpretation.

4.2.5 Thermocyclers used by the collaborators

Thermocyclers used by the collaborators are given in Table 22.

Table 22 – Thermocyclers tested during the interlaboratory study

Total QS5	**7**
Total CFX Opus Deepwell	**4**

4.3 Calculation and summary of data

The raw data are given in **Appendix 8**.

4.3.1 MicroVal Expert laboratory results

The results obtained by the expert laboratory are given in Table 23.

Table 23 – Results obtained by the expert Lab.

Level	Reference method	Alternative method with: the CFX 96, the CFX Opus DW and the QS5 (Fast)
L0	0+/8	0+/8
L1	5+/8	6+/8
L2	7+/8	8+/8

Fractional positive results were obtained with the reference and the alternative methods at level 1.
At Level L0, late positive PCR results with negative confirmation ($PD_{FP(alt)}$ samples) were observed, three using the CFX Opus (samples n°2, 5 and 9) and one using the QS5 PCR instrument (sample n°8). PCR replicates were performed, yielding both positive and negative results. A new DNA extraction subsequently produced negative results for all concerned samples.
At Level L1, one sample with PCR negative result (sample n°16) obtained positive confirmation after RVS and MKTTn subcultures. In this case, the level of detection of the alternative method was probably not reached.

It can be noted that it was required to perform several PCR prior to obtained an interpretable data set due to an invalid negative control (late positive curves). This situation was also encountered by another collaborator (J).

4.3.2 Results observed by the collaborative laboratories

> *Mesophilic aerobic flora enumeration*

Depending on the Lab results, the enumeration levels varied from $1.7.10^4$ CFU/g to $3.6.10^6$ CFU/g for collaborators who performed the analyses at Day 1 or Day 2.
The collaborator N, who performed the analyses at Day 4, obtained a high aerobic mesophilic flora enumeration (2.6×10^8 CFU/g). See Table 24.

Table 24 - Mesophilic flora enumeration

Collaborators	Mesophilic flora enumeration (CFU/g)

Three collaborators (C, D and G) obtained more than one positive sample at level L0 with the reference method (2, 2 and 5 positive samples respectively onto 8 no contaminated samples). For alternative method, these collaborators obtained also positive results at level L0:

- Collaborator C: 4 samples with negative PCR results gave positive confirmations after RVS and MKTTn subculture (n°2, 13, 19 and 22).
- Collaborator D: 2 samples gave positive PCR results, with negative confirmation for one sample (n°13) and positive confirmation after RVS and MKTTn subcultures for the other sample (n°22).
- Collaborator G: the 8 samples gave positive PCR results, with positive confirmation for two of them (n°8 and n°13).

These datasets will not be considered for the final interpretation, as the results obtained may have been affected by improper handling practices.

Five other collaborators (B1, E, H, I1, L) have obtained presumptive positive sample with negative confirmation at level L0 with the alternative method. PCR replicates were performed and gave negative PCR results for all samples except for the sample n°9 from collaborator L. These results can be due to cross-contaminations during the extraction process or late positive curves due to threshold placement. It can be noted that some late positive curves have also been found by the expert lab and a root cause analysis will be performed to better understand these observations.

For the final interpretation, it is proposed to exclude data from collaborators E, I1 and L but keep collaborators B1 and H with only one presumptive positive at Level 0 observed and zero at level L1 or L2. This will allow to obtain the appropriate number of datasets for the study.

Among the ten datasets retained for interpretation, two collaborators from the same laboratory (B1 and B2) did not follow the instructions regarding result interpretation and the modification of the default Cq cutoff value from 35 to 39 for the QS5 PCR instrument. These collaborators have used same software for PCR Setup and post PCR data analysis (QuantStudio™Desing&Analysys) instead of two different softwares (QuantStudio™Desing&Analysys for PCR Setup and Design&Analysys for post PCR data analysis) as indicated in the IFU.
Consequently, the data were reanalyzed by ADRIA using the right software for the analysis. Both sets of interpretations are available in the raw data. For most of the samples, this does not impact the final outcome. However, for sample 1, results were considered negative (ND_{FNalt}) with the new interpretation while initially found positive by the laboratory. The interpretation carried out by ADRIA was used for the final analysis.

4.3.3 *Results of the collaborators retained for interpretation*

The results obtained with the 10 collaborators kept for interpretation are presented in Table 27 (reference method) and Table 28 (alternative method).

Table 27 - Positive results by the reference method
(Without collaborators C, D, E, G, I1, L and N)

Collaborators	Contamination level		
	L0	L1	L2

Total	$P_0 = 2$	$C_0 = 0$	$CP_0 = 0$	$P_1 = 54$	$C_1 = 54$	$CP_1 = 54$	$P_2 = 76$	$C_2 = 77$	$CP_2 = 76$

4.3.4 Calculation of the specificity percentage (SP)

The percentage specificities (SP) of the reference method and of the alternative method, using the data after confirmation, based on the results of level L0, are the following (See Table 28).

Table 28 - Percentage specificity

Specificity for the reference method	$SP_{ref} = \left(1 - \left(\frac{P_0}{N_-}\right)\right) x\ 100\ \% =$	100.0 %
Specificity for the alternative method *before confirmation*	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-}\right)\right) x\ 100\ \% =$	97.5 %
Specificity for the alternative method *after confirmation*	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-}\right)\right) x\ 100\ \% =$	100.0 %

N: number of all L0 tests
P_0 = total number of false-positive results obtained with the blank samples before confirmation
CP_0 = total number of false-positive results obtained with the blank samples

4.3.5 Calculation of sensitivity (SE_{alt}), sensitivity for the reference method (SE_{ref}), relative trueness (RT, false positive ratio for the alternative method (FPR) and false negative ratio for the alternative method (FNR)

Fractional positive results were obtained for the low inoculation level L1: 67.5 %. Both inoculation levels L1 were retained for calculation.

A summary of the results of the collaborators retained for interpretation and obtained with the reference and the alternative methods for Level 1 is provided in Table 29.

Table 29 - Summary of results for all collaborators obtained with the reference and alternative methods for Level 1

Level	Response	Reference method positive (R+)	Reference method negative (R-)
L1	Alternative method positive (A+)	Positive agreement (A+/R+) **PA = 45**	Positive deviation (R-/A+) **PD = 9**
	Alternative method negative (A-)	Total Negative deviation (A-/R+) **TND = 15** **(0 $ND_{FN(alt)}$ and 0 $PA_{FP(alt)}$)**	Total Negative agreement (A-/R-) **TNA = 11** **(0 $NA_{FN(alt)}$ and 0 $PD_{FP(alt)}$)**

Based on the data summarized in Table 29, the values of sensitivity of the alternative and reference methods, as well as the relative trueness and false positive ratio for the alternative method taking account the confirmations, are the following (See Table 30).

Table 30 - Sensitivity, relative trueness, false positive ratio and false negative ratio percentages

		Level L1
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + TND + PD)} x\ 100\ \%$	78.3 %
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + TND)}{(PA + TND + PD)} x\ 100\ \%$	87.0 %
Relative trueness	$RT = \frac{(PA + TNA)}{N} x100\ \%$	70.0 %
False positive ratio for the alternative method (unpaired evaluation)	$FPR = \frac{PA_{FP(alt)} + PD_{FP\,(alt)}}{TNA} x\ 100\ \%$	0.0 %
False negative ratio for the alternative method (unpaired evaluation)	$FNR = \frac{NA_{FN(alt)} + ND_{FN(alt)}}{PA + TND + PD}$	0.0 %

Unpaired study

With $TNA = NA + NA_{FN\,(alt)} + PD_{FP\,(alt)}$ $TND = ND + ND_{FN\,(alt)} + PA_{FP\,(alt)}$

4.3.6 Interpretation of trueness data

Negative deviations are listed in Table 31 for Level 1.

Positive deviations are listed in Table 32 for Level 1.

Table 31 - Negative deviations for Level 1

Level	Collaborator	Sample	Reference method	Alternative method	
				PCR result	Confirmation result
L1	B1	**4**	+	-	-
		7	+	-	-
		18	+	-	-

		18	+	-	-
		24	+	-	-
	M	**16**	+	-	-
		24	+	-	-

Table 32 - Positive deviations for Level 1 and for Level 2

Level	Collaborator	Sample	Reference method	Alternative method	
				PCR result	Confirmation result
1	B1	**16**	-	+	+
	B2	**26**	-	+	+
		37	-	+	+
		38	-	+	+
	I2	**46**	-	+	+
	J	**18**	-	+	+
	K	**7**	-	+	+
	M	**11**	-	+	+
	O	**24**	-	+	+

For an **unpaired study design**, the difference between (TND – PD) is calculated for the level(s) where fractional recovery is obtained (so L_1 and possibly L_2). The observed value found for (TND – PD) shall not be higher than the AL. The AL is defined as $[(TND - PD)_{max}]$ and calculated per level where fractional recovery is obtained as described below using the following three parameters:

$$(p+)_{ref} = \frac{P_{x\,(ref)}}{N_{x\,(ref)}}$$

where

$P_{x(ref)}$ = is number of samples with a positive result obtained with the reference method at level *x* (L_1 or L_2) for all laboratories

$N_{x(ref)}$ = is number of samples tested at level *x* (L_1 or L_2) with the reference method by all laboratories

$$(p+)_{alt} = \frac{CP_{x\,(alt)}}{N_{x\,(alt)}}$$

where

$CP_{x(alt)}$ = is number of samples with a confirmed positive result obtained with the alternative method at level *x* (L_1 or L_2) for all laboratories

$N_{x(alt)}$ = is number of samples tested at level *x* (L_1 or L_2) with the alternative method by all laboratories

$$(TND - PD)_{max} = \sqrt{3N_{x\,(ref)}\; x\; ((p+)_{ref} + (p+)_{alt} - 2((p+)_{ref}\; x\; (p+)_{alt}))}$$

where

$N_{x(ref)}$ = is number of samples tested for level *x* (L_1 or L_2) with the reference method by all laboratories.

The AL is not met when the observed value is higher than the AL. When the AL is not met, investigations should be made (e.g. root cause analysis) in order to provide an explanation of the observed results. Based on the AL and the additional information, it is decided whether the alternative method is regarded as not fit for purpose. The reasons for acceptance of the alternative method when the AL is not met shall be stated in the study report.

In this study, fractional recovery was observed at Level 1. The calculations are the following, according to the ISO 16140-2:2016 and ISO 16140-2/A1:2024 (See Table 33).

Table 33 - Calculations

	Level 1	Level 2
N_X	80	88
$(p+)_{ref}$	0.750	0.988
$(p+)_{alt}$	0.675	0.950
AL = (TND - PD) max	9.95	3.83
TND - PD	6	3
Conclusion	TND-PD < AL	TND-PD < AL

The ISO 16140-2:2016 and ISO 16140-2/A1:2024 requirements are fulfilled as (TND - PD) is below the Acceptability limit (AL) for Level 1 and Level 2.

4.3.7 *Evaluation of the LOD $_{50\%}$ and RLOD between laboratories*

The LOD $_{50\%}$, was calculated using the EN ISO 16140-2 Excel spreadsheet available at https://standards.iso.org/iso/16140/-2/ed-1/en/amd/1/PODLOD-interlab_ver2.xlsm
The RLOD is defined as the ratio of the LODs of the alternative method and the reference method: **RLOD = LOD_{alt}/LOD_{ref}.**
The results are given in Table 34.

Table 34 - LOD $_{50\%}$ and RLOD

Method	LOD 50%	RLOD
Reference	0.5 [0.4; 0.7]	1.5
Alternative	0.7 [0.5; 1.0]	

5 GENERAL CONCLUSION

The **method comparison study conclusions** are:

Overall, the conclusions for the Method Comparison Study are:

- The scope of the method is broad range of food and production environmental samples with an exclusion on raw poultry and dust samples. Five food categories and one production environmental category were tested.
- The observed values for TND-PD and TND+PD for the individual categories and for all categories and protocols meet the acceptability limits (observed values ≤ AL) for QS5 and CFX96.
- For CFX Opus, the results meet the acceptability limits for the individual category and the mixed protocol but are just above the limits for the combined paired protocol. This instrument will be kept in the scope of the method. A mention is added in the IFU for both CFX Opus and CFX 96 in order to consider all curves with a sigmoidal shape (even below the threshold) as a potential positive result.
- It is possible to store the enrichment broth for 72h at 5 ± 3°C.
- The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 1.5 for paired studies and 2.5 for unpaired studies.
- All target strains have been detected, with sometimes the requirement to add milk in the enrichment broth. None of the non-target strain have been detected.

The **inter-laboratory study conclusions** are:

- Despite some cross-contamination observed during the study and presumptive positive results observed at level 0 by the collaborator and the expert laboratory, the data retained for interpretation showed acceptable performance with no false positive nor false negative observed at the fractional recovery level (level 1).
- The observed value for TND-PD is lower than the acceptability limits.

- The data and interpretations comply with the ISO 16140-2:2016, ISO 16140-2/A1:2024 requirements.
- The Salmo*fast* PCR method is considered equivalent to the ISO standard.

Appendix 2 - Flow diagram of the alternative method: Salmo*fast* PCR

25 g of sample + 225 ml BPW
For all foods, except raw dairy, raw fish and seafood
Environmental samples: 25 g + 225 mL BPW
Swab + 10 ml BPW[2]
Sponge + 100 ml BPW[2,3]
Wipe + 225 ml BPW[3]

25 g of sample + 225 ml BPW + novobiocin (20 mg/L)
For raw dairy, raw fish and seafood
according to ISO 6887 parts

↓

Incubation
16-20 h at 34 - 38°C ± 1°C

↓ Direct streaking (10µL) onto XLD and Oxoid Brillance *Salmonella*

↓ ISO 6579-1 protocol

↓ Lysis (55 µL enriched sample)

↓ PCR test (5µL) using QS5 or CFX96 or CFX Opus DW

↓ Positive result

↓ Confirmation of typical colonies by

Thermo Scientific *Salmonella* Latex Agglutination
or biochemical and serological test according to ISO 6579-1

[2] For sampling after cleaning process pre-moisten
- 1 swab + 1 mL broth universal neutralizing (+ 9 mL BPW)
- 1 sponge + 10 mL broth universal neutralizing (+ 90 mL BPW)
- 1 wipe + BPW + 10% neutralizing agent (+ 215 mL BPW).

Note: Neutralizing agent is composed of phosphate disodique, Thiosulfate de sodium, Lécithine, Tween® 80, - L - Histidine

Appendix 3 - Kit insert(s)

See attached
